### Review comments

An interesting case. Two long presentation and definitely too many data in table. It should be more complex. Do we know medical history of this patient? Maybe he suffered for liver disease before COVID-19? Was he transplanted finally?

*Thank you for your feedback. We have added in the case report a sentence describing that he was previously healthy and that he died under palliative care, so he did not undergo LT.*

Comments to the authors: An interesting and rare case.

But the table is too long, I think that histopathology results are enough to be presented in a letter. Could you give some medical history to this patient?

*Thank you for your feedback. The purpose of the table is to give complete data on the case, as the cases published in The American Journal of Gastroenterology. We would like to keep the table as it is.*
