Review Comments

This is an interesting paper, exploring the field of vision from different body positions. However, there are some skeptical aspects regarding the case, and I would like to raise two points.

Firstly, there is no description of the patient's case, including the imaging findings and the indications for surgery. More details would be helpful to understand this case.

Reply: **We have added the description of the patient's clinical information.**

Changes in the text: **Please see page 5, line 73-82.**

Secondly, there needs to be a description of how to handle cases of adhesion or bleeding in the prone position. It would be helpful to include information on how to convert to conventional laparoscopy if possible, in order to deal with such issues.

It is necessary to include a method for handling bleeding and adhesions during surgery in the prone position.

I believe including the above information would further enhance the understanding of this case.

Reply: **We have added the description of how to handle cases of adhesion or bleeding in the prone position. We also have described how to convert to conventional laparoscopy.**

Changes in the text: **Please see page 7, line 133-135.**
