Review Comments

In my opinion, the analyzed topic is interesting enough to attract the readers' attention. This study explored the risk factors of pelvic floor dysfunction in cervical cancer patients after surgery and established a possible predictive model.

Reply 1: We thanks for your positive feedback.

I think that the abstract of this article is very clear and well structured.

Reply 2: We thanks for your positive feedback.

In my opinion, the discussion could be studied in depth and extended. Maybe, it could be useful the evaluation of new possible surgical approaches and their long-term outcomes which may increase patients' quality of life. Also, it could be interesting the evaluation of the state of the art about possible consequences of surgical treatment of this disease. In particular, I suggest these articles to get deeper in the topic, respectively: PMID: 32744453, PMID: 28786873. Because of these reasons, the article should be revised and completed. Considered all these points, I think it could be of interest for the readers and, in my opinion, it deserves the priority to be published after minor revisions.

Reply 3: Thanks for your suggestion. We have revised the manuscript accordingly. In page 6, line 185-197, we discussed the possible consequences of surgical treatment of this disease. In page 6, we added the incidence of urinary incontinence and sexual dysfunction. And in page 7, line 209-210, we added the related reference. See page 6, line 185-197, line 180 and page 7, line 209-210.
