Post-hoc explorative subgroup analysis was performed to detect the potential patients who can benefit from measure of NT-proBNP. Stratification factors including age, gender, GRACE score, single/multi-vessel lesion, revascularization strategy, LVEF. Some abbreviations are denoted as follows: GRACE, Global Registry of Acute Coronary Events; MT, medical therapy; PCI, percutaneous coronary intervention; CABG, coronary artery bypass grafting; LVEF, left ventricular ejection fraction. \*, adjusted HR was calculated based on multivariable Cox proportional hazard model.

Harrell C-index reflected the discrimination of the variable(s), the greater value is, the greater discrimination ability is. The net reclassification improvement (NRI) and integrated discrimination improvement (IDI) were also used to evaluate the additional clinical value of NT-proBNP. The positive value of IDI and NRI means positive improvement. NA, not available.
