

Supplemental Data 1 Thromboembolism workup

We performed a workup for thromboembolism on day 4 of hospitalization. We did not find any form of thromboembolism. Our calculated Wells score was 3. An arterial duplex scan found arterial occlusion (likely from the vasospasm) but did not find an uncompressible area of the veins that would indicate deep vein thrombosis (DVT). There was no edema or warmth of the legs on physical exam. A CT angiogram of the chest did not find evidence of pulmonary embolism.
