

Table S1 Conversion of total nomogram points to predicted probability of POPF

Total nomogram points	Predicted probability of POPF (%)
≤80	<1
81–90	1–2
91–100	2–6
101–110	6–17
111–120	17–38
121–130	38–65
131–140	65–85
141–150	85–95
151–160	95–98

Conversion table translating the total nomogram points into the predicted probability of POPF, based on the final nomogram scale. Probabilities were estimated by converting the corresponding linear predictor values shown in the nomogram into event probabilities. POPF, postoperative pancreatic fistula.
