

Appendix 1**Methods****Calculation of sign scores**

Motor signs were sum on MDS-UPDRS part III in early-stage PD: (I) bradykinesia (item 3.4–3.8), which describe finger tapping, hand movement, rapid alternating and leg agility; (II) rigidity (item 3.3), which describe rigidity of the neck, arm and leg; (III) tremor (item 3.15–3.18), which describe postural tremor, kinetic tremor, tremor rest lip/jaw and constancy of rest tremor; (IV) axial signs (item 3.1, 3.2, 3.9–3.14), which measure speech, facial, posture, postural stability and gait (item 3.10, 3.11).

[#], use Pearson and others use Spearman correlation analysis. Axial signs without gait score. The significance threshold was set at 0.05, two-tailed. *, P<0.05. The brain regions are reported based on the Automated Anatomical Labeling atlas: DCG, median cingulate and paracingulate gyrus; IFGoper, inferior frontal gyrus, opercular part; LING, lingual gyrus; ORBsupmed, superior frontal gyrus, medial orbital; SFGdor, superior frontal gyrus, dorsolateral; SMA, supplementary motor area; STG, superior temporal gyrus; THA, thalamus; TPOsup, temporal pole: superior temporal gyrus. PD, Parkinson's disease; FDR, false discovery rate.
