Continuous variables are expressed as mean ± SD or median [IQR], and the categorical variables are indicated as n (%). +, positive; -, negative. AFP, alpha fetoprotein; ALT, alanine aminotransferase; APRI, AST to Platelet Ratio Index; AST, aspartate aminotransferase; BMI, body mass index; DAA, direct acting antiviral; FIB-4, Fibrosis-4 index; MELD, Model for End-Stage Liver Disease; HCC, hepatocellular carcinoma; HCV, hepatitis C virus; INR, international normalized ratio; IQR, interquartile range; SD, standard deviation; TE, transient elastography; WBC, white blood cell count.

**Figure S2** Changes in the ANA titers before and after DAA treatment. This alluvial plot shows the changes in ANA titers before and after DAA treatment. ANA titers declined significantly after SVR ( $P=0.006$ ). At PreTx, 27.4%, 8%, and 1% of patients showed ANA titers of 1:80, 1:160, and  $\geq 1:320$ , respectively. After achieving SVR, these proportions changed to 19.4% at 1:80, 3.5% at 1:160, and 1% at  $\geq 1:320$ . Among patients with initial titers of 1:80, 25% transitioned to ANA negativity, while 25% maintained the status quo at 1:80 titer. For those with initial titers of 1:160, 25% underwent conversion to ANA negativity, 38% transitioned to 1:80, and 38% maintained the 1:160 titer. Among the patients who initially presented with 1:320 titer, 50% transitioned to ANA negativity, and 50% maintained the 1:320 titer. Notably, among patients who were initially ANA-negative at PreTx and transitioned to an ANA-positive status, all exhibited ANA titers of 1:80. ANA, anti-nuclear antibody; DAA, direct-acting antiviral; SVR, sustained virological response; PreTx, pretreatment.

**Figure S3** Changes in the ANA titers before and after DAA treatment depending on autoimmune disease. (A) No autoimmune disease. (B) Autoimmune disease. DAA, direct-acting antiviral; ANA, anti-nuclear antibody.

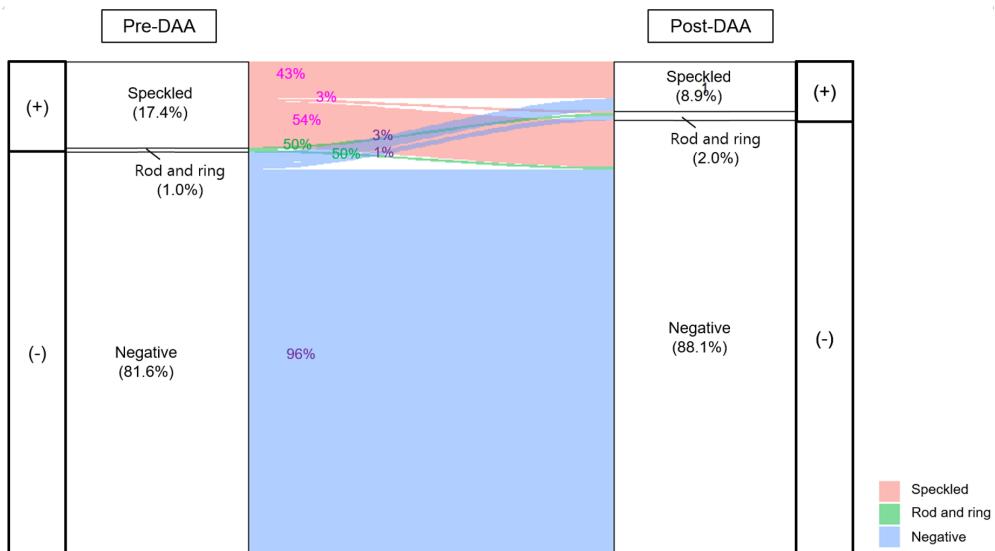

**Figure S4** Changes in cytoplasmic antibody before and after DAA treatment. This alluvial plot shows changes in cytoplasmic antibody levels before and after DAA treatment with SVR. The proportion of cytoplasmic ANA positivity decreased significantly from 18.4% at PreTx to 10.9% at SVR ( $P=0.006$ ). DAA, direct-acting antiviral; SVR, sustained virological response; PreTx, pretreatment.

**Table S5** Changes of cytoplasmic positivity and patterns in HCV patients receiving DAA therapy

Variables	Pre-DAA (n=201)	Post-DAA (n=201)	P value
Cytoplasmic	37 (18.4)	22 (10.9)	0.006
Speckled	35 (17.4)	18 (9.0)	0.07
Rod and ring	2 (1.0)	4 (2.0)	–

Data are presented as n (%). HCV, hepatitis C virus; DAA, direct acting antiviral.

**Figure S5** Changes in cytoplasmic antibody patterns before and after DAA treatment. DAA, direct-acting antiviral; SVR, sustained virological response; PreTx, pretreatment.

**Table S6** Changes of ANA pattern in ANA positive HCV patients receiving DAA therapy

Variables	ANA (+) → (+) (n=37)	ANA (+) → (-) (n=28)	P value
Nuclear			0.09
Homogenous	20 (54.1)	8 (28.6)	
Speckled	14 (37.8)	13 (46.4)	
Nucleolar	0 (0.0)	4 (14.3)
