

Figure S1 Visualization of missing data intersections across multiple variables. This plot presents a 2D bar chart depicting the intersection sizes of missing data across five variables: Postoperative_complications_NA, Comorbidities_NA, Family_history_NA, Smoking_index_NA, and Smoking_cessation_NA. The vertical bars on the right show the number of observations with missing values for combinations of variables, with the height of each bar indicating the frequency of missing value intersections. The horizontal section at the bottom displays the set sizes for each variable, along with dots and connecting lines that represent the pattern of missing data for each combination of variables. 2D, two-dimensional.

Table S1 T and N stage distribution for stage III patients

T & N stage	Number (n=37)

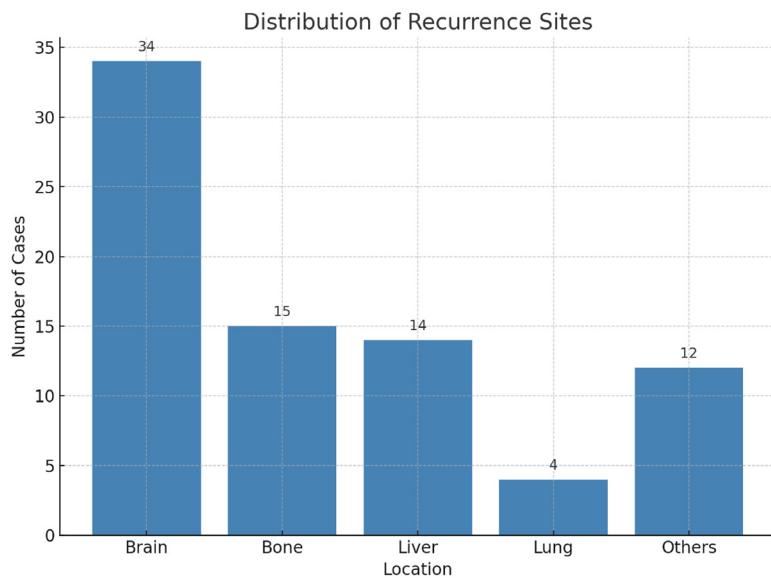

Figure S2 Distribution of recurrence sites. Bar plot showing the distribution of recurrence sites among patients who developed postoperative recurrence or metastasis. The most common site of recurrence was the brain (n=34), followed by bone (n=15), liver (n=14), and others (n=12). Pulmonary recurrence was relatively rare (n=4).

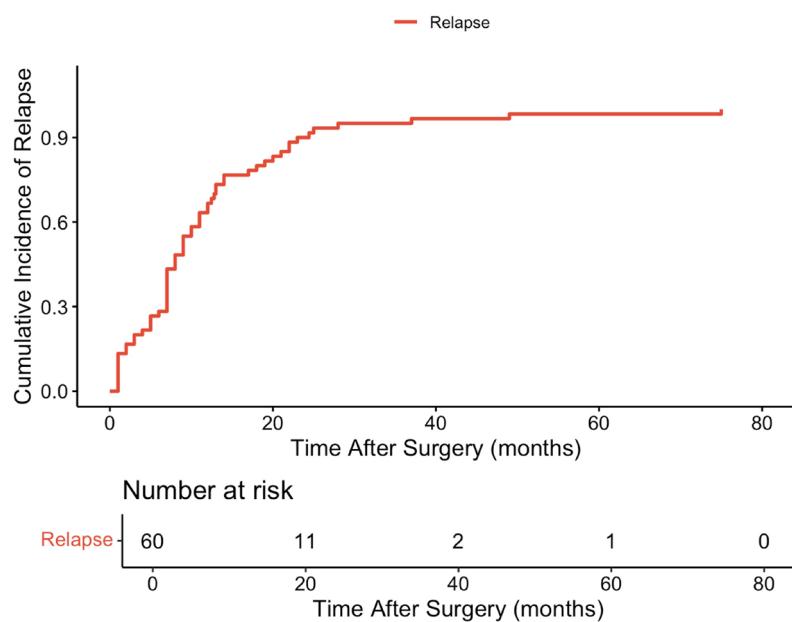

Figure S3 Cumulative incidence curve of postoperative relapse. Cumulative incidence curve illustrating the time-to-relapse distribution among patients after surgical resection.
