

Figure S1 (A) Chest computed tomography (CT) scan (left) of patient 11 showed tumor regression after receiving 2 courses neoadjuvant therapy with ICI, compared to initial CT scan (right). (B) Magnetic resonance imaging (MRI) of patient 5 in head showed multiple metastases in the left frontal lobe, right parietal lobe, and occipital lobe. (C) Bone metastases were detected in lumbar vertebra, left anterior ribs, left ischia, and left sacroiliac joints by bone scan of patient 2. The green arrow represents the site of bone metastasis, in which the bone density and metabolic activity changed.
