

Figure S1 Diagram of 15 metabolic pathways, being altered in lung adenocarcinoma patients. Alanine metabolism- alanine, aspartate and glutamate metabolism; Arginine Proline, arginine and proline metabolism; Amino sugar, amino sugar metabolism; TCA, citric acid cycle; Fructose, fructose and mannose metabolism; Glycolysis, glycolysis and gluconeogenesis; PPP, pentose metabolism; Nicotine metabolism, nicotine and nicotinamide metabolism; Glycerolipid, glycerolipid metabolism; Sphingolipid, sphingolipid metabolism; Purine, purine metabolism; Pyrimidine, pyrimidine metabolism.

Table S1 Lung adenocarcinoma cohorts demographic and clinical information

Characteristic	Lung adenocarcinoma Wikoff (n=39)	Lung adenocarcinoma Moreno (n=33)	Lung adenocarcinoma TCGA (n=522)
Age, y			
Gender	72.3±8.78	62.1±9.73	65.8±0.45
Male	15 (38%)	24 (73%)	242 (46%)
Female	24 (62%)	9 (23%)	280 (54%)
Race			
White			393 (75%)
Black or African American			53 (10%)
Other			9 (2%)
NA	39 (100%)	33 (100%)	67 (13%)
Smoking status			
Smoking	39 (100%)		402 (77%)
Non-smoking			120 (23%)
NA		33 (100%)	
AJCC stage, n (%)			
I	39 (100%)	17 (52%)	279 (53%)
II		10 (30%)	124 (24%)
III		6 (18%)	85 (16%)
IV			26 (5%)
NA			8 (2%)
Treatment			
Radiotherapy only			160 (31%)
Chemotherapy only			284 (54%)
Chemo-radiation			78 (15%)
NA	39 (100%)	33 (100%)	
Length of clinical follow-up from diagnosis, mo			23.93

Figure S2 Metabolic genes of clinical significance in non-squamous non-small cell lung cancer. Orange indicates hazard ratio of clinically relevant genes associated with shorter OS; green indicates Hazard Ratio of clinically relevant genes associated with longer OS. DF, degree of freedom; Std. Err, standard error; Chi Sq, Chi squared test; HR, hazard ratio; raw_p, raw P value; pfdr, p-FDR corrected P value; OS, overall survival.

Figure S3 Incidence of function altering mutations of non-clinically relevant and clinically relevant genes controlling cellular metabolism in non-small cell lung cancer. Data presented as frequency of function altering mutations (%) per superpathway. Each point represents frequency of mutation in individual gene. Frequency of mutations in 522 patients from lung adenocarcinoma cohort.

Table S2 RNA expression of metabolic genes of clinical significance in non-squamous non-small cell lung cancer

Gene	Non-mutated	Mutated	P value

Figure S4 Metabolic maps with altered metabolites and clinically relevant genes in lung adenocarcinoma. (A) Alanine, aspartate and glutamate metabolism; (B) Glutathione metabolism; (C) Arginine biosynthesis; (D) Arginine and proline metabolism; (E) Amino sugar and nucleotide sugar metabolism; (F) Citrate cycle; (G) Fructose and mannose metabolism; (H) Glycolysis/gluconeogenesis; (I) Pentose phosphate pathway; (J) Nicotinate and nicotinamide metabolism; (K) Riboflavin metabolism; (L) Fatty acid biosynthesis; (M) Glycerolipid metabolism; (N) Sphingolipid metabolism; (O) Purine metabolism; (P) Pyrimidine metabolism. Metabolites, being altered in lung adenocarcinoma are colored in blue; genes, function altering mutations in which associated with worst prognosis colored in red; and genes, function altering mutations in which associated with good prognosis colored in green.

Table S3 Effect of clinical and demographic factors on frequency of mutations in metabolic superpathway of non-squamous non-small cell lung cancer

Factors	Metabolic superpathways				
	Amino acids	Carbohydrates	Cofactors	Lipids	Nucleotides
Gender (M vs. F, P value)	16.9% vs. 17.5%, P=0.866	12.0% vs. 10.4%, P=0.556	3.7% vs. 3.2%, P=0.753	9.5% vs. 7.5%, P=0.412	21.5% vs. 15.7%, P=0.090
Smoking status (non-smoking vs. smoking, P value)	10.8% vs. 19.2%, P=0.027*	8.3% vs. 11.9%, P=0.273	2.5% vs. 3.7%, P=0.502	7.5% vs. 8.7%, P=0.673	10.0% vs. 20.9%, P=0.004*
AJCC stage (stages I + II vs. stages III + IV, P value)	16.6% vs. 19.8%, P=0.437	10.2% vs. 14.4%, P=0.221	3.0% vs. 3.6%, P=0.741	7.9% vs. 10.9%, P=0.351	19.4% vs. 11.7%, P=0.052

Frequency of mutations is expressed in percentile value (%) between demographic and clinical groups. Putative differences between groups were tested using Fisher's exact test. Significant P values, i.e., P<0.05 between non-smoker vs. smokers are indicated by *.

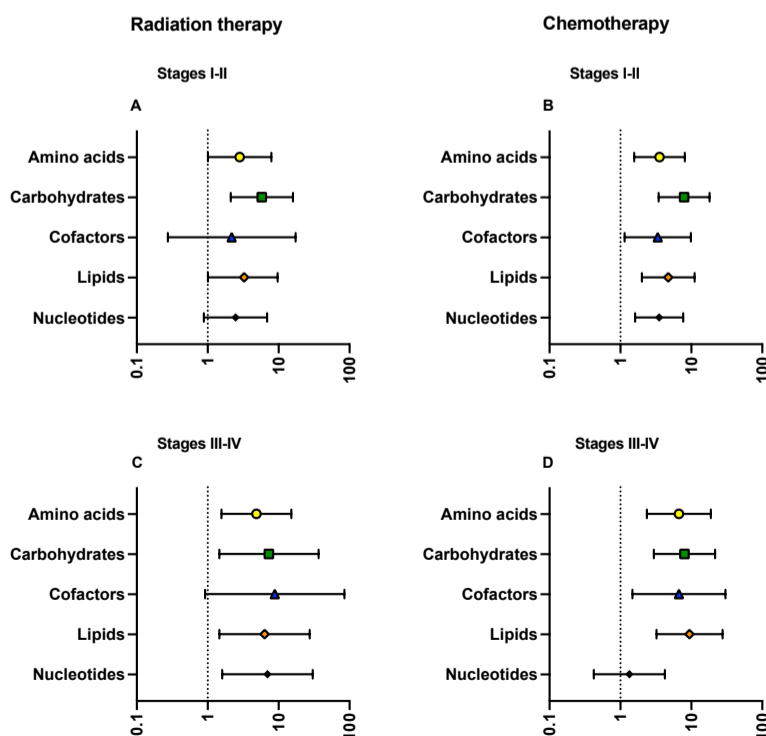

Figure S5 The relative impact of individual metabolic alterations on overall survival of LUAD cohort. Forest plots show the hazard ratio +/- 95% confidence intervals for each clinically relevant metabolic pathway in LUAD from the TCGA database. (A,C) LUAD patients received radiation therapy only. (B,D) LUAD patients received chemotherapy only. (A,B) Patients with early stages of disease (stages I and II are combined), (C,D) Patients with late stages of disease (stages III and IV are combined). LUAD, lung adenocarcinoma.
