## **Interview questions on surgical wait times**

### **Introduction:**

On behalf of Alberta Health, we're surveying individuals involved in surgical care in Canada. You recently indicated you would be willing to participate in a survey regarding approaches to improve access to elective surgical care. We are especially interested in successes and challenges you've experienced in reducing wait times for elective surgeries such as joint replacements, cataract removal, and general surgical procedures.

The information we collect will be kept confidential. It will be summarized and no individual will be identifiable from the results. We'll be happy to share the findings with you once the report is complete.

1. What is your role in addressing access to elective surgical procedures in your jurisdiction?
  
2. How are wait times for elective surgeries measured in your organization? Do you measure any other factors that might influence wait times?
  
3. How are wait times for elective surgeries such as joint replacements, cataract removal, etc. defined in your jurisdiction? Do you think there are hidden wait times impacting access to surgery that are not actively measured?
  
4. What approaches have been developed and/or implemented that aim to reduce wait times and improve access to elective surgery in your jurisdiction? If applicable, please answer the following questions:
  - a. What was the timeframe for development and implementation of the approaches?
  
  - b. Who was responsible for initiating, developing, and implementing the approaches?

- c. What were the factors contributing to long wait times that these approaches were intended to address?
  - d. Was the approach tailored to the procedure? For example, was a different approach used to reduce wait times for joint replacements vs. cataract removal?
  - e. Are marginalized populations taken into consideration (e.g., indigenous peoples, low socioeconomic status, etc.)? Are there any other ways in which your jurisdiction works to ensure improved access to surgery for marginalized populations specifically?
  - f. Has any formal evaluation of these approaches been done? Were the approaches successful? Why or why not?
  - g. If the approaches have been successful in reducing wait times, how will they be sustained long term?
  - h. Based on your experience, can you provide any “lessons learned” for jurisdictions that may be considering similar approaches?
5. Are you aware of any other issues in your jurisdiction that contribute to limited access and increased wait times that are not being addressed through any formal approach?

6. Is there anything else about your experiences with addressing wait times that you would like to share?

7. Is there anyone else that you think we should talk to for more information on initiatives in your jurisdiction or elsewhere?

Thank you for your time!

Table S1. Central intake

Example	Healthcare setting (year implemented)	Specialty area	Purpose	Centralized referral and triage	Pooled waiting list	Screening	Other components	Impact
<b>Caleo Health Spine Partnership(8)</b>	Regional (Not reported)	Orthopedic/neurosurgery	To address the delay in access to multi-disciplinary assessment and management of patients with spinal diseases and injuries	Yes	Yes	Yes	<ul style="list-style-type: none"> <li>• Standardized referral form</li> <li>• Multi-disciplinary team (spine-focused physician, physiotherapist, chiropractor, and rehabilitation coordinators)                             <ul style="list-style-type: none"> <li>- Triage and assessment performed by non-specialist team</li> </ul> </li> <li>• Patient choice of first available surgeon or specific surgeon</li> <li>• Data management system</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• Approximately 44% of spine assessment patients are surgical candidates, while 56% are deemed non-surgical</li> </ul>
<b>Alberta Bone &amp; Joint Health Institute hip and knee clinics(9-12)</b>	Provincial (Not reported)	Orthopedic	To provide excellent bone and joint care, and help patients to relieve arthritis pain	Yes	Yes	Yes	<ul style="list-style-type: none"> <li>• All services (other than family doctor visits and in-hospital care) provided in or through a hip and knee clinic (Edmonton, Calgary, Red Deer, Camrose, Grande Prairie, Lethbridge, Medicine Hat, Westlock)</li> <li>• Part of a standardized care pathway</li> <li>• Standardized referral form</li> <li>• Multi-disciplinary team (bone &amp; joint specialists, nurse, rehabilitation team, administrative staff, and research assistants)                             <ul style="list-style-type: none"> <li>- Screening assessments performed by nurses</li> </ul> </li> <li>• Prioritization criteria for triage: appropriateness, medical fitness, and urgency</li> <li>• Patient choice of first available surgeon or specific surgeon</li> <li>• Care plans for patients identified as non-surgical</li> <li>• Case manager to support patient through surgical journey</li> <li>• Data management system</li> <li>• Established evidence-based criteria for screening, referral to home care following surgery, and when considering transfer to sub-acute care following surgery</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• In a pilot randomized controlled study* (performed by the Alberta Bone &amp; Joint Health Institute) in which 1700 patients were allocated to the new care path and 1700 patients were allocated to the traditional care path, patients who followed the new care path had significantly greater improvement in general health, less pain after surgery, and greater ability to perform normal daily activities than those who received conventional care</li> <li>• Waiting times for consultation with a specialist and for surgery declined dramatically</li> <li>• New continuum:                             <ul style="list-style-type: none"> <li>- Wait from referral to first consultation: 21</li> <li>- Wait from first consultation to surgery: 7.5 weeks</li> <li>- LOS 4.7 days</li> <li>- 85% mobilized day of</li> </ul> </li> <li>• Current approach:                             <ul style="list-style-type: none"> <li>- Wait from referral to first consultation: 145 days</li> <li>- Wait from first consultation to surgery: 58 weeks</li> <li>- LOS 6 days</li> <li>- 31% mobilized day of</li> </ul> </li> <li>• The degree of improvement among patients in the new continuum of care exceeded that of patients in the conventional approach as measured by the WOMAC and SF-36</li> <li>• Patients in the new continuum of care had a 36% improvement in their average</li> </ul>

Table S1. Central intake

Example	Healthcare setting (year implemented)	Specialty area	Purpose	Centralized referral and triage	Pooled waiting list	Screening	Other components	Impact
								<p>WOMAC score, compared with a 31% improvement for patients in the conventional approach</p> <ul style="list-style-type: none"> <li>The lower total cost to public health care together with improved patient outcomes indicate the new continuum is more cost-effective than the conventional approach to hip and knee replacement</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>
<b>Facilitated Access to Treatment (FAST) (Interview)</b>	Regional (Not reported)	General surgery	To improve access and reduce wait times for elective surgeries	Yes	Yes	Yes	<ul style="list-style-type: none"> <li>Standardized referral form</li> <li>Surgeon champion to provide guidance when team is uncertain how to triage a referral</li> <li>Patient choice of first available surgeon or specific surgeon</li> </ul>	<p><i>Interview:</i></p> <ul style="list-style-type: none"> <li>Program was expanded to shoulder and spine surgeries</li> <li>Requests have been received to establish similar programs for foot and ankle, thoracic, obstetrics and gynecology, and ophthalmology</li> <li>95% of referrals go to first available surgeon</li> <li>Fewer cancellations or “no shows”</li> <li>Fewer incidences of family doctors sending referrals to multiple surgeons</li> <li>Patients are getting in to see surgeons sooner, although they may still have to wait a while for the actual surgery</li> <li>For the program to work, you need all surgeons to “buy in” before you begin. Few surgeons may be interested in participating at the start.</li> <li>When the program was expanded to the University, the importance of having all surgeons engaged was emphasized, as referrals were coming from the same family physicians and PCNs for all of the surgeons</li> <li>If the family physicians begin sending their referrals to central intake only, the surgeons not involved may begin losing out. Reluctance to join the program was primarily around fear of receiving less referrals and, consequently, less income</li> <li>To improve buy-in, they demonstrated that surgeons still had the same number of surgical candidates on their lists</li> </ul>

Table S1. Central intake

Example	Healthcare setting (year implemented)	Specialty area	Purpose	Centralized referral and triage	Pooled waiting list	Screening	Other components	Impact
								<ul style="list-style-type: none"> <li>• Their number of referrals may be slightly smaller, but primarily because the inappropriate referrals (duplicates, patient doesn't want surgery, patient already had surgery, etc.) are removed</li> <li>• Patients have reported back that this was their best experience in getting in to see a surgeon, even though they still had to wait a long time to have surgery</li> <li>• Patients were more satisfied because they knew that someone was actually looking at their referral. The uncertainty over whether anyone has their referral is stressful for patients.</li> </ul>
<b>Alberta Thoracic Oncology Program(13)</b>	Provincial (Not reported)	Oncology	To offer rapid, state of the art, multidisciplinary evaluation of patients with suspected malignancies	Yes	Yes	No	<ul style="list-style-type: none"> <li>• Part of a standardized, integrated care pathway</li> <li>• CT required for referrals with suspected lung cancer</li> <li>• Direct referrals from radiologists are now possible</li> <li>• Referrals are reviewed and triaged by nurse practitioners</li> <li>• Access to all lung cancer diagnostic and staging modalities</li> <li>• First consultation is with the nurse practitioner or a respirologist</li> <li>• Collaboration with Thoracic Surgery and Lung Tumour Group oncologists to discuss therapeutic plans</li> <li>• Pre-operative assessment of pulmonary function</li> </ul>	Not reported
<b>Cardiac Ensuring Access and Speedy Evaluation (EASE) program(14, 15)</b>	3-year pilot (2003) Operational program at Mazankowski Alberta heart Institute(2006)	Cardiothoracic	To streamline the efficiency of consultation by cardiologists	Yes	Yes	No	<ul style="list-style-type: none"> <li>• Referrals reviewed by clinic secretary to ensure completeness</li> <li>• Referrals better suited to previous cardiologist or specialty clinic were forwarded on</li> <li>• Multidisciplinary team (cardiologists, nurse practitioners, doctoral-trained pharmacists, cardiac technician, and sonographer) <ul style="list-style-type: none"> <li>- Triage performed by a nurse practitioner based on pre-consultation information, diagnostic testing available or ordered by the EASE team, and information from the referring physician</li> </ul> </li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• In a single evaluation of the 3-year pilot data, mean wait time from receipt of referral to date seen in consultation was reduced from 71 ± 45 days in the pre-EASE group vs. 33 ± 19 days in the EASE group (p&lt;0.0001)</li> <li>• Wait times for pre-EASE patients originating within the form Capital Health Region were longer than waits for patients referred from outside the region. This effect was attenuated with Cardiac EASE. Mean wait time adjusted for baseline confounders, age and geographical origin still showed a</li> </ul>

Table S1. Central intake

Example	Healthcare setting (year implemented)	Specialty area	Purpose	Centralized referral and triage	Pooled waiting list	Screening	Other components	Impact
							<ul style="list-style-type: none"> <li>- Initial consultation began with the NP/PharmD performing a detail history and physical, and collating all laboratory and non-invasive testing</li> <li>- Cardiologist conducted an assessment focused on aspects deemed pertinent, discusses diagnoses/treatment options, and implements a management strategy</li> <li>- NP or PharmD reinforced the care plan and coordinated follow-up testing and procedures</li> <li>- Non-invasive diagnostic testing by the cardiology technician and sonographer typically coordinated with the first consult</li> <li>• Prioritization criteria for triage: patients coded based on urgency from 0 to 3               <ul style="list-style-type: none"> <li>- Patients in categories 0 (emergent) or 3 (not needing follow-up within 3 months) not considered for EASE</li> <li>- Patients in category 1 (urgent) scheduled within 1 week</li> <li>- Patients in category 2 (stable) seen within 4-6 weeks</li> </ul> </li> <li>• Patients requiring &gt; 2 visits transferred to a cardiologist's individual clinic</li> <li>• Telehealth was planned to be used patients residing far outside of Edmonton to review diagnostic testing and laboratory results</li> </ul>	<ul style="list-style-type: none"> <li>significant reduction in the EASE group (p&lt;0.0001).</li> <li>• Mean wait from date of referral to the date first booked was also significantly shorter in the EASE group (p&lt;0.0001).</li> <li>• Wait to a definitive diagnostic decision and treatment plan was significantly shorter for the EASE group compared to the pre-EASE group (51 ± 58 days vs. 120 ± 86 days, p&lt;0.0001).</li> <li>• Volume increased by nearly 50% in 2005 and by 19% in 2006. Consequently, wait times increased from 24 ± 13 days in 2004 to 42 ± 20 days in 2006 (p&lt;0.05). However, patients were still seen significantly sooner in each year of the pilot than in the pre-EASE period (p&lt;0.0001).</li> <li>• 98% of the EASE group had follow-up scheduled with their family doctor compared to 85% of the pre-EASE group.</li> <li>• Rapidity of feedback to referring physician through a transcribed letter was not significantly different between the pre-EASE and EASE group (8 ± 22 days vs. 9 ± 14 days, p=0.51).</li> </ul>
<b>Central Access and Triage(16)</b>	Provincial (Not reported)	Various (Gastroenterology, hematology and hematologic malignancies, cardiothoracic)	To improve service integration and patient access to primary care and specialist medical services	Yes	Yes	No	<ul style="list-style-type: none"> <li>• Standardized referral form</li> <li>• Prioritization criteria: urgency (emergent, urgent, semi-urgent, and routine referral types)               <ul style="list-style-type: none"> <li>- Implementation of Western Canada wait list prioritization tools for rheumatology, nephrology, gastroenterology, and geriatric referrals was planned for 2009</li> </ul> </li> <li>• Confirmation of receipt of referral, acceptance, and appointment scheduling</li> <li>• Patient choice of first available surgeon or specific surgeon</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• Preliminary evaluations have reported decreased wait times and timely access for patients requiring urgent care</li> <li>• Pooled referrals have eliminated duplicate referrals and wait times for physicians have equalized</li> <li>• Health care providers reported increase ease and efficiency of referrals</li> <li>• In the rheumatology CAT pilot (2006), there was a 15 to 37% reduction in wait times, depending on urgency</li> <li>• Between 2005 and 2008, mean wait time to consultation for urgent-level</li> </ul>

Table S1. Central intake

Example	Healthcare setting (year implemented)	Specialty area	Purpose	Centralized referral and triage	Pooled waiting list	Screening	Other components	Impact
								<p>referrals decreased from 29 ± 46 days to 17 ± 14 days (p&lt;0.05)</p> <ul style="list-style-type: none"> <li>• Mean wait time to consultation for moderate-level referrals decreased from 110 ± 57 days to 63 ± 42 days (p&lt;0.00005)</li> <li>• Mean wait time to consultation for routine-level referrals decreased from 155 ± 88 days to 108 ± 37 days</li> <li>• Wait list shopping by referring family doctors was documented to have ended</li> </ul> <p>• In the gastroenterology pilot, there was an 8% reduction in wait times, despite 153% increase in referrals</p>
<b>Canada- British Columbia</b>								
<b>Burnaby Hospital Central Intake and Optimization Clinic for Arthroplasty(17) (interview)</b>	Hospital (Not reported)	Orthopedic	To provide better access to joint replacement surgery	Yes	Yes	Yes	<ul style="list-style-type: none"> <li>• Standardized referral form</li> <li>• Multi-disciplinary team                             <ul style="list-style-type: none"> <li>- Initial assessment performed by intake nurse</li> </ul> </li> <li>• Patient choice of first available surgeon or specific surgeon</li> <li>• Preoperative education and support for surgical candidates</li> <li>• Cancellation list</li> <li>• SuperPath approach offered to eligible patients</li> <li>• Non-surgical patients and patients who do not want surgery within 6 months referred back to their family doctor with information about alternative treatment options</li> <li>• Data management system</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• Similar models have been implemented at the Vancouver General Hospital, as well as in Vancouver Island and Prince George. There were plans to expand to other centres in late 2018</li> </ul> <p><i>Interview:</i></p> <ul style="list-style-type: none"> <li>• Central intake and screening clinics do minimize wait 1 but, while non-operative patients are screened out, the patients who needs to see a surgeon waits twice</li> <li>• The majority of patients do not meet the criteria to be excluded from surgery</li> </ul>
Interior Breast Rapid Access Investigation and Diagnosis (IB-RAPID)(18)	Regional pilot (2011)	Oncology	To address the issue of wait times for breast cancer care not meeting acceptable benchmarks	Yes	Yes	Yes	<ul style="list-style-type: none"> <li>• A nurse navigator facilitates all relevant imaging tests and biopsies, obtains pathology reports and expedites surgical referrals</li> <li>• They nurse navigator also provides information and support to patients/families one-on-one and in group educational events involving other health care providers</li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• Wait times from 1st imaging to surgical intervention decreased with the introduction of IB-RAPID (59 vs 48 days, median)</li> <li>• The implementation of nurse navigation for patients with breast cancer appears to be effective at reducing the wait times for surgical treatment</li> <li>• Either a well-defined care process or an individual tasked with guiding patients through the health care system appears to</li> </ul>

						*Note: impact based on implementation alongside other approaches
Canada- Ontario(33)	Regional (2007)	To actively manage patients requiring hip and knee replacement surgery across the entire continuum of care	Orthopedic	Surgeon	• Joint Health and Disease Management Program implemented patient choice of first available surgeon or a specific surgeon	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• In a report published by the LHIN*, it was stated that 90% of patients in the LHIN are waiting &lt;115 days for hip or knee replacement surgery vs. the provincial target of 182 days</li> <li>• Wait from date of referral to first consultation with a surgeon is &lt;100 days</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>
Canada- Saskatchewan(40)	Provincial (Not reported)	To provide patients with quicker access to specialists by maximizing the use of all specialists evenly	Various: <ul style="list-style-type: none"> <li>• Cardiothoracic</li> <li>• OBGYN</li> <li>• Orthopedic</li> <li>• General surgery</li> <li>• Gastroenterology</li> <li>• Hematology</li> <li>• Urology</li> <li>• Neurosurgery</li> </ul>	Surgeon	• Pooled referrals have implemented patient choice of first available surgeon or a specific surgeon	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• Pooled referrals are a popular choice amongst patients.</li> <li>• A Regina gynecologist was quoted as saying that her colleagues were not hard to convince of the benefits of pooled referrals. They receive a steady stream of appropriate referrals and the system matches the flow of referrals to the capacity of the specialists.</li> </ul>
Canada- Saskatchewan(36-38)	Provincial (2010)	To improve quality for lower back pain care by encouraging guidelines-concordant evidence-based primary care while reducing wait times for appropriate MRI and surgical referral	Orthopedics/ neurosurgery (spine)	Surgeon	• Spine Pathway Clinics have implemented patient choice of first available surgeon or a specific surgeon	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• In a retrospective analysis of 215 consecutive new patient referrals between June 1, 2011 and May 30, 2012, it was reported that SSP clinic referrals were significantly more likely to be candidates for surgery than referrals from outside an SSP clinic (59.1 vs. 37.6%, p=0.003)</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>
New Zealand(57)	Regional (Not reported)	To reduce waiting times for first specialist appointments, 'did not attend' rates, and work for administrative staff to reschedule appointments	Various	Consultation date	<ul style="list-style-type: none"> <li>• A Patient Focused Booking system ('U Book') was established in Hutt Valley District Health Board, which sends patients a letter inviting them to call the outpatient clinic to arrange a convenient time to be seen</li> <li>• The DHB indicated that it would also have an online booking system for patients up and running in 2012</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• 'Did not attend' rates reduced from 13-15% to 7-8% over a 3-month period, and have been maintained at this level</li> <li>• Cancellations have reduced</li> <li>• 'Rework' for administration staff is significantly lower</li> <li>• According to a survey, patient satisfaction is very high, waiting times in 2 specialties have reduced</li> </ul>
United Kingdom – England(106-108)	National (pilot 2005, full 2006)	To increase patient choice and receive treatment faster	Various	Hospital	• Patients requiring planned hospital care were able to book appointments from their choice of four to five	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• One study was based on administrative discharge data from the UK Department of Health</li> </ul>

Table S5. Patient choice

Jurisdiction	Healthcare setting (year implemented)	Purpose	Specialty area	Choice type	Description	Impact
					<p>providers (chosen by their primary care trusts) at the point of referral from their family doctor, paid for by the NHS</p> <ul style="list-style-type: none"> <li>family doctors were required to ensure that patients were made aware of, and offered, choice</li> </ul>	<p>(data from every hospital in the England NHS from 2003 to 2008; analysis included 13,500 elective CABG discharges). Mean waiting times from referral to treatment decreased when choice was available, but other policies such as enforcement of waiting time targets were also in place. The average probability of being informed about choice was about 50%, showing that not all physicians did offer choice as mandated by the reform. The study also reported that patients were more responsive to clinical quality than wait times when choosing a hospital.</p> <ul style="list-style-type: none"> <li>In a literature review of studies from the discipline of economics</li> <li>Patients who are older, female, have lower educational qualifications, or who look after children are less likely to indicate that they wish to take up choice. Patients are willing to trade-off waiting time against reputation of the hospital, with some indication that this trade-off is affected by the income of the patient</li> <li>It also appears that lower waiting times for those in the scheme were not at the expense of patients who were not in the scheme. Waiting times for all patients fell as sending hospitals responded to loss of patients (and funding) by improved performance on waiting times and receiving hospitals did not increase waiting times for other patients at the hospital</li> </ul>
<b>United Kingdom – England(109)</b>	Not reported	Not reported	Various	Consultation date	<ul style="list-style-type: none"> <li>A pilot study of electronic booking of out-patient appointments allowed patients to be booked into the next available urgent or routine appointment as appropriate, have the choice of date for their appointments</li> <li>A clinical appointment with a specialist was done on the same day as the referral through an electronic system</li> </ul>	<p><i>Peer-reviewed literature:*</i></p> <ul style="list-style-type: none"> <li>The appointment booking was achieved on the same day as the referral was made, whereas it took an average of 7 days for paper referral</li> <li>There was no significant difference in the time from referral to being seen in clinic between the electronic and paper (i.e. traditional referral) group (8 days vs 10 days)</li> <li>Non-attendance rate for the electronic group was 8.5% whereas for the paper group was 22.5%</li> <li>Patients in the electronic group were less likely to change their appointment than those in the paper group</li> </ul>

Table S5. Patient choice

Jurisdiction	Healthcare setting (year implemented)	Purpose	Specialty area	Choice type	Description	Impact
						*Note: impact based on implementation alongside other approaches
United Kingdom – Scotland(53, 83, 110)	National (2003)	Not reported	Various	Consultation date	<ul style="list-style-type: none"> <li>• Patient-focused booking process was implemented, where patients are sent a letter detailing the timeframe their appointment will be within and they contact the service to book an actual appointment slot</li> <li>• Patient Focused Booking refers to a set of processes and procedures to manage the waiting list; a set of principles around patient booking (such that no appointment is made without the direct involvement of the patient); and a set of practices such as dedicated resources to provide a single and central point of contact for patients within the hospital</li> <li>• Patient focused booking also uses clinical priority and time on the waiting list to calculate when a patient will be seen (patients placed on waiting lists are sorted first by clinical priority and then by waiting time)</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• Data from one health authority (NHS Dumfries and Galloway) was modeled to compare actual waiting times to possible waiting time through patient focused booking and found that maximum wait times were reduced from 44 weeks to 21 weeks</li> <li>• Patients are more likely to attend as they have had some choice in the timing of the slot. Those that do not respond to the initial letter can be followed up and some will turn out not to require the appointment anymore</li> <li>• Ensure the appointment letter provides a prompt for patients to let you know if the appointment is no longer required. Consider reminder options such as telephone and SMS</li> <li>• When introducing Patient Focused Booking it is essential to have staff leave policies in place, which require six weeks notice for any leave which will affect an outpatient clinic</li> <li>• The combination of booking patients only four weeks in advance of their appointment and the application of the staff leave policy leads to fewer hospital cancellations (The few cancellations at short notice (e.g. due to sickness) can be rescheduled into an empty clinic in five weeks time)</li> </ul>

Table S6. Process improvement methodology

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
<i>Lean</i>					
Canada- Alberta (111-115)	Provincial (2013)	Various	To reduce wait times through quality improvement initiatives	<ul style="list-style-type: none"> <li>• A LEAN project was initiated to address increased wait time at three centres, to assess patient and paper workflow from receipt of referral to consult. Standardizing the referral process across all zones and testing of new e-referral technology is being rolled out across the remaining tumour groups; to be completed by the end of 2013</li> </ul>	Not reported
United Kingdom-England(116)	Hospital (2007)	ENT	To increase efficiency in order to comply with the Department of Health’s maximum wait time target of 18 weeks for cochlear implantation	<p>Lean</p> <p>The 5 steps of Lean were followed and improvement opportunities were identified</p> <ul style="list-style-type: none"> <li>• A single experienced clerical staff member appointed to oversee the patient pathway</li> <li>• Management workload devolved to management and clinicians encouraged to concentrate of patient care</li> <li>• Production of a pre-patient pack containing critical information about the procedure and technology and an invitation to book a number of key appointments</li> <li>• Appointments to be booked in blocks</li> <li>• Patients found unsuitable for implantation identified early and brought to the multidisciplinary committee (MDT) for agreement to discharge</li> <li>• MDT meetings held to manage patient decisions</li> <li>• Expansion of working hours</li> </ul>	<p><i>Peer-reviewed studies:</i></p> <ul style="list-style-type: none"> <li>• 141 long waiting patients included</li> <li>• 43 patients were lost to follow up/died/withdrew from assessment</li> <li>• 10 patients had been assessed or were awaiting implant</li> <li>• Remaining 88 were assessed; 42 were deemed unsuitable for implantation and 46 were offered the implant (3 declined)</li> <li>• Of the 46, 11 went on to a trial of the implant</li> <li>• Of the remaining 35 who went on to implantation, 31 (89%) met the 18 week target. 3 of the remaining 4 were unless at time of scheduled implantation, and the last patient needed another intervention prior to implantation</li> </ul>
United States (117)	Hospital (2013) <i>pilot</i>	General surgery	To reduce current delay and wait times in VA institutions	<p>Lean</p> <p>The Value Stream Analysis (in 2013) identified several “Just Do Its” (JDIs) and conducted raid process improvement workshops (RPIWs), and projects for simple, medium and complex solutions. Improvements learned in JDIs were implemented immediately, and more complex reforms from RPIWs and projects were rolled out in stepwise fashion. Committees continued to meet to review ongoing metrics.</p>	<p><i>Peer-reviewed studies:</i></p> <ul style="list-style-type: none"> <li>• Mean (SD) of wait time for general surgery statistically significantly decreased from 33.4 (8.3) days in 2012 to 26.0 (9.5) days in 2013. This appeared to coincide with the rollout of several RPIWs. In 2014, these numbers fell further to 12.0 (2.1) days.</li> <li>• Total operative volume increased from 931 patients in 2012 to 1090 in 2013 and 1072 in 2014, with no changes in surgeons or patient mix, despite the closure of one OR in early 2014.</li> <li>• Clinic volume fluctuated from 3131 visits in 2012 to 3241 in 2013, and to 3084 visits in 2014, but this was offset by increased use of telehealth approaches, including e-consultations, where medical record review is used to answer a specific question without necessitating a clinic visit, and clinical video teleconferencing (CVT). E-consultations rose from 50 in 2012 to 64 in 2013 to 129 in 2014. Clinical video teleconferencing visits, which were not available in 2012, rose from 155 visits in 2013 to 304 in 2014.</li> </ul>

Table S6. Process improvement methodology

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
					Thus, combined clinic, CVT, and e-consultation encounters increased from 3131 in 2012 to 3460 in 2013 and 3517 in 2014. <ul style="list-style-type: none"> <li>Despite the increased number of patients seen, no shows decreased from 366 in 2012 and 346 in 2013 to 227 in 2014 (<math>P = .02</math>)</li> </ul>
United States(118)	Five hospitals/health systems (Not reported)	Various	To reduce wait times	<p>Improving flow:</p> <ul style="list-style-type: none"> <li>Kaiser Permanente addressed elective surgery wait times by examining the entire care pathway and instituting process changes, e.g., longer use of ORs, Saturday procedures, and simple process changes. This improved efficiency and OR utilization rose to 85%</li> <li>Using Lean principles, and reviewing workflow and improvements to OTR processes, scheduled operations in Seattle Childrens' Hospital start on time with a 99% success rate.</li> </ul> <p>Balancing supply and demand:</p> <ul style="list-style-type: none"> <li>Lean approaches have been used in Seattle Childrens' Hospital to improve scheduling and wait time challenges. A centralized scheduling centre coupled with a standardized process to manage schedules and fill vacancies has yielded a more efficient and streamlined process.</li> <li>Evening clinics have been instituted based on trending data for hourly, weekly and seasonal variations.</li> <li>At the Mayo Clinic, flexibility of provider supply has been increased. Full schedules are set as the expectation for specialty physicians. Rather than allowing schedule gaps, specialists are scheduled to see general patients. <ul style="list-style-type: none"> <li>In Denver Health, appointment utilization was maximized using same-day appointments.</li> <li>Kaiser Permanente evaluated historical data to staff appropriately with fluctuations in time.</li> </ul> </li> </ul>	Not reported
<i>Others</i>					
Canada- Alberta (111-115)	Provincial (Not reported)	Various	To reduce wait times through quality improvement initiatives	<ul style="list-style-type: none"> <li>AIM (Access, Improvement, Measure) quality improvement involved finding efficiencies in all parts of the processes in the Alberta Hip &amp; Knee Clinic (Calgary) and the Edmonton Musculoskeletal Clinic.</li> </ul>	<p><i>Grey literature:</i></p> <p>In a one-year period, the wait time between referral to the clinic and initial consult has been reduced from five months to less than three months.</p> <ul style="list-style-type: none"> <li>In a one-year period, the wait time between referral to the Calgary clinic and initial consult has been reduced from five months to less than three months. Patients at Edmonton's hip and knee clinic have seen their wait times cut by 80. In a one-year period, the wait time between referral to the surgeon-owned clinic and initial consult has been reduced from 10 months to &lt;2 months.</li> </ul>

				<ul style="list-style-type: none"> <li>After receiving a response, family doctors can either close the encounter or reply for further clarification</li> </ul>	<ul style="list-style-type: none"> <li>In a single costing study, it was found that the multispecialty Champlain BASE eConsult service generated cost savings from the societal perspective (net societal savings of \$38 729 over a 1 year period)</li> </ul>
<b>Canada- Quebec(133)</b>	Provincial (Not reported)	Not reported	To reduce wait times for specialist consultations	<ul style="list-style-type: none"> <li>eConsult Québec platform was established to enable rapid communication between family doctors, family doctors, nurse practitioners, and medical specialists</li> <li>Specialists respond within 3 days</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>Information obtained through eConsult can be integrated into patient care in 66% of cases, or even confirm a course of action already being considered by the PCP in 33% of cases</li> <li>“The results of our impact analysis are promising and are generating enthusiasm with our key partners, notably within the Ministry of Health and Social Services,” adds Dr. Maxine Dumas Pilon, eConsult Québec steering committee president.</li> </ul>
<b>Canada- Saskatchewan(133)</b>	Provincial (Not reported)	Not reported	To support primary care physicians to work to their full scope of practice, reduce wait time to see specialists and reduce the number of inappropriate referrals sent to specialists	<ul style="list-style-type: none"> <li>LINK, a provincial physician-to-physician telephone consultation service, was established to give family physicians quick access to specialists for consult on acute and complex but non-urgent conditions</li> </ul>	Not reported
<b>New Zealand(57)</b>	Regional (Not reported)	Not reported	Not reported	<ul style="list-style-type: none"> <li>An electronic service was established to provide specialist advice according to clinical history and findings as reported by the referring practitioner</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>Approach shown to reduce wait times</li> </ul>
<b>United Kingdom – England(137)</b>	National (2018)	Not reported	Not reported	<ul style="list-style-type: none"> <li>An ‘advice and guidance’ option was implemented within the NHS e-Referral Service (e-RS) to avoid the need to default to an outpatient referral</li> <li>The advice and guidance feature was designed to allow clinicians to have multi-way conversations about patients using the e-RS feature</li> <li>80% of requests receive a response within 2 working days</li> </ul>	Not reported
<b>United Kingdom – Scotland(138)</b>	Pilot (Not reported)	Oncology	To enable true skin malignancies to be diagnosed earlier and subsequently treated sooner, as well as reduce the pressure of outpatient clinics	<ul style="list-style-type: none"> <li>In a pilot study, family doctors used an electronic referral service to send digital images to the plastic surgery department for suspected skin malignancy</li> <li>An onsite-training package was established for family doctors on the use of the camera and the attachment of images to the referral letter electronically</li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>Results from 300 patients included in the study who underwent the electronic referral system</li> <li>Mean wait time from referral to diagnosis reduced from 10.9 days (traditional referral system) to 2 days (electronic system)</li> </ul>

Table S8. Specialist advice request

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<ul style="list-style-type: none"> <li>• The specialist on call screened (triaged) and vetted all referrals received enabling all patients to be assessed within one day</li> <li>• All images were accompanied by a full letter including history, relevant past medical history and current medication</li> </ul>	<ul style="list-style-type: none"> <li>• Mean wait time from diagnosis to treatment was similar between the traditional and electronic system</li> <li>• Mean wait time from referral to treatment reduced from 59 days (traditional) to 28 days (electronic) for urgent cases</li> <li>• Mean wait time from referral to treatment reduced from 126 days (traditional) to 52 days (electronic) for 'soon' cases</li> <li>• Mean wait time from referral to treatment reduced from 303 days (traditional) to 65 days (electronic) for routine cases</li> <li>• Mean overall correct diagnosis was 83.2%</li> <li>• Total of 90.2% of malignant lesion and 76.6% of benign lesions were correctly identified</li> <li>• A questionnaire was sent to 34 family doctors and 25 of them responded. 88% felt that the feedback from surgeons has been educationally valuable and has enhanced the patient journey (84%)</li> <li>• A questionnaire was sent to 31 patients and 21 of them responded. None of the patients were unhappy about the overall treatment</li> </ul>

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
Canada- Alberta(111, 126, 139-141)	Provincial (Not reported)	Various	To streamline the referral process	<ul style="list-style-type: none"> <li>• The province-wide eReferral system was developed with the assistance of ABJHI and AHS's Bone and Joint Health Strategic Clinical Network (BJH SCN)</li> <li>• eReferral simplifies the referral process by standardizing the information required to be submitted with the referral</li> <li>• The system informs the referring physicians of the waiting time to see the specialist before they transmit the referral</li> <li>• It also makes referral status updates available in real time, any time.</li> <li>• With eReferral, AHS has introduced to Alberta's physicians standardized referral forms and standardized wait times rules, terminologies and metrics</li> <li>• The definitions of key events during the wait, the start and end times of these events, and the practices used to measure data are the same across the province.</li> <li>• eReferral eliminates errors by standardizing the information required on the electronic form</li> <li>• Missing referral information causes hours of extra work and adds as much as six weeks to the wait to see a specialist</li> <li>• Lost referrals will be a problem of the past as the transmission and exchange of paper are eliminated</li> <li>• The eReferral system has been integrated with Alberta Netcare, a secure and confidential health record database where all patient health information is integrated, stored and made available to authorized health care providers</li> <li>• Only physicians who have adopted Alberta Netcare can use eReferral</li> <li>• AHS is encouraging physicians to give up paper-based referrals and adopt eReferral and Netcare</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• Standardization reduces the wide variability in what is being measured and how it is being measured when tracking wait times for hip and knee replacements</li> </ul>
Canada- Alberta (interview)	Provincial (Not reported)	Various	Not reported	<ul style="list-style-type: none"> <li>• Standardized referral forms have been implemented for all sites using ACATS (~93% of sites)</li> </ul>	Not reported
Canada- Alberta (interview)	Provincial (Not reported)	Oncology	To avoid patients falling through the cracks	<ul style="list-style-type: none"> <li>• Alberta Thoracic Oncology Program established a protocol in which all CT scans in which a spot is detected result in automatic referral to their program</li> <li>• An arrangement was made with radiologists so that they include a note in their voice dictations to refer to ATOP and an immediate fax is sent to the program</li> </ul>	<p><i>Interview:</i></p> <ul style="list-style-type: none"> <li>• Patients no longer fall through the cracks and the time to be seen in consultation dropped by 14-15 days</li> <li>• However, they now have a number of CT scans with lumps that don't necessarily need to be seen by ATOP surgeons</li> <li>• They may get repeat referrals or contact patients who have had a benign lump for years that does not bother them</li> </ul>
Canada- Manitoba (interview)	Provincial (Not reported)	Orthopedic	Not reported	<ul style="list-style-type: none"> <li>• Central intake process for hip and knee replacements implemented a streamlined, single-page referral form, which must include an x-ray</li> </ul>	<p><i>Interview:</i></p> <ul style="list-style-type: none"> <li>• The electronic referral system was not able to build a critical mass of specialists and referring clinicians quickly enough, so despite</li> </ul>

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<ul style="list-style-type: none"> <li>• Process also ensures family doctors receive acknowledgement of referral as well as a notification when consult is booked and a report back on outcomes and next steps</li> </ul>	initial very positive results, its value was not fully realized and it was retired
<b>Canada- Newfoundland(142)</b>	Regional (Not reported)	Various, endoscopy, and diagnostic imaging	Not reported	<ul style="list-style-type: none"> <li>• Standardized booking processes were implemented in the Labrador-Grenfell health authority through the development of regionally standardized request forms for surgical, endoscopy, and diagnostic imaging procedures.</li> <li>• No other details were reported.</li> </ul>	Not reported
<b>Canada- Ontario (interview)</b>	Regional (Not reported)	Not reported	Not reported	<ul style="list-style-type: none"> <li>• Some LHINs have implemented e-Referral (e.g. in Southern Ontario)</li> <li>• The Ministry hasn't decided to take a lead on establishing a preferred vendor</li> <li>• A lack of standardized referral is one of the reasons why MRIs/CTs are such an issue in Ontario as the data provided in requisition forms often isn't enough to indicate if a scan is actually required</li> </ul>	Not reported
<b>Canada- Saskatchewan(36-38)</b>	Not reported	Orthopedics/ neurosurgery (spine)	To improve compliance to the Saskatchewan Spine Pathway	<ul style="list-style-type: none"> <li>• The Saskatchewan Spine Pathway (SSP) implemented several strategies to improve compliance, including structured referral forms</li> </ul>	<p><i>Peer reviewed literature:</i>*</p> <ul style="list-style-type: none"> <li>• In a retrospective analysis of 215 consecutive new patient referrals between June 1, 2011 and May 30, 2012, it was reported that SSP clinic referrals were significantly more likely to be candidates for surgery than referrals from outside an SSP clinic (59.1 vs. 37.6%, p=0.003)</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>
<b>Australia- New South Wales(143)</b>	Regional (2014)	Ophthalmology	To improve quality, safety and health care experience for Ophthalmology patients	<ul style="list-style-type: none"> <li>• A new model of care was developed collaboratively between Health Executives, Ophthalmology clinicians, nurse specialists and orthoptists in New South Wales to improve clinical engagement and more seamless partnerships with internal and external providers</li> <li>• Innovative local solutions were developed which included strong clinician leadership and engagement, a revised model of care, introduction of a standardized referral/triage service and concurrent surgical sessions for Registrars</li> </ul>	<p><i>Grey literature:</i>*</p> <ul style="list-style-type: none"> <li>• As of June 2014, 6 months after the project commenced, all patients clinic waitlist was cleared and new clinic wait times were reduced to &lt; 365 days, over 150% reduction to pre-project wait times</li> <li>• The project also increased access to ophthalmic surgery, thus improving efficiencies and meeting key performance indicators and service measures</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>
<b>Australia- Queensland(144)</b>	Hospital (2008)	Various	To reduce wait lists to access specialist clinics in the public system	<ul style="list-style-type: none"> <li>• The Townsville Hospital, the family doctor Liaison Officer, family doctors and hospital staff including specialists, collaborated to develop a process to review patients waiting longer than two years</li> <li>• The template was developed to collect a minimum data set for each of the specialities. The minimum data set was used to</li> </ul>	<p><i>Peer-reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• At the end of 2009 the wait time for orthopedics, ENT, neurosurgery, and urology was 2 years, and the wait time for general surgery was down to 1 year</li> </ul>

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<p>update clinical information for the long wait process and to ensure all appropriate investigations had been performed</p> <ul style="list-style-type: none"> <li>The purpose of the template was to improve the adequacy of the information contained in the referral and to enhance appropriate triaging.</li> <li>A letter sent to long wait patients (patients who were on the wait list for longer than 2 years) offered two options 1) take no action if the appointment was no longer required or 2) visit their family doctor to update their referral on a clinic specific template if they felt the referral was still required</li> <li>Local family doctors were advised of the trial and provided education on the new template and minimum data required for specialist referrals</li> </ul>	<ul style="list-style-type: none"> <li>By the end of 2010 wait time is expected to be 1 year for general surgery, 18 months for orthopedics and ENT, neurosurgery and urology, and 2 years for ophthalmology and vascular surgery</li> <li>All stakeholders benefit: family doctors have access to consultant opinion for their patients; specialists have improved referral data enabling clinical management decisions at the first consultation; and patients who need procedures receive them</li> <li>It was noted that this process would have been much easier to achieve if referral communication was electronic rather than paper based. An additional advantage of an electronic system would be the accuracy of referral data to accurately evaluate the process</li> </ul>
Australia – Queensland (145)	State (2018)	Various	To streamline the referral process to specialist outpatient services	<ul style="list-style-type: none"> <li>Smart Referrals was implemented in Queensland to streamline referrals from family doctors to specialist</li> <li>An integrated online directory was embedded in the system with a listing of specialist public outpatient services, where and how they are offered, referring requirements and expected clinic wait time</li> <li>family doctors access their practice management software, create an electronic referral and submit it to the health service</li> <li>Smart Referrals auto populates referral information and flagging anything that needs to be attached,</li> <li>Smart Referrals allows family doctors to track and follow up a referral, ensuring referrals are not lost or duplicated</li> <li>The referral is securely submitted to the right place, where it is electronically processed and triaged according to its clinical urgency</li> <li>Smart Referrals also allows hospital and health service staff to create and submit referrals to any public specialist across Queensland</li> <li>Referral Lodgement and Tracking provides technical capability to facilitate digital lodgement and tracking referrals across the state</li> <li>Smart Referrals Workflow provides digital capability to facilitate the seamless receipt, registration and triage of specialist outpatient referrals</li> <li>Smart Referrals are expected to improve:                             <ul style="list-style-type: none"> <li>Safety and quality of care—enhanced quality of referral information, informs clinical handover, triage and treatment of patients.</li> <li>Workflow efficiency—faster, streamlined referral management supports better patient outcomes. ◦ Patient</li> </ul> </li> </ul>	Not reported

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<p>experience—enhanced quality of referral information reduces wait times.</p> <ul style="list-style-type: none"> <li>- family doctor experience—quicker and easier for family doctors to refer.</li> <li>- Clinician experience—enhanced decision support information improves patient care.</li> <li>- Financial benefits—reduction in referral rework and avoidable appointments.</li> </ul>	
<b>Australia – Queensland(101)</b>	State (2016)	Various	To develop consistent referral practices and standards across the state	<ul style="list-style-type: none"> <li>• As part of Queensland Health’s larger strategy to provide additional specialist outpatient appointments, eReferrals were implemented to ensure referrals are sent to the right place the first time</li> <li>• By 2020, family doctors will also have access to an online statewide directory of public hospital services to better inform and direct their referrals</li> <li>• The Government invested \$361.2 million over 4 years to provide more specialist outpatient appointments for Queenslanders and to fix known problems in key parts of the patient journey by 2020</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• By 2017, more patients will be seen within clinically recommended times and current long waits will be reduced</li> </ul>
<b>Australia – South Australia(4)</b>	Pilot (2006) Hospital (2008)	Orthopedic	To optimize conservative management but ensure that joint replacement surgery is undertaken in an appropriate and timely manner	<ul style="list-style-type: none"> <li>• The Orthopaedic Unit of the Repatriation General Hospital (RGH) in Adelaide, South Australia implemented a quality care management system for patients with arthritis of the hip and knee</li> <li>• As part of the system, a standardized referral template was developed</li> <li>• There was a focus on the development and implementation of an evidence-based referral and triage system sought to ensure timely response to new patients appropriate to the severity of their disease</li> <li>• This element featured a standardized Referral Template with a minimum dataset and supporting Referral Guidelines for family doctors</li> </ul>	<p><i>Peer-reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• Over 4 years the model has: reduced waiting times for initial outpatient assessment from 10 to 3 months and surgery from 18 to 8 months, increased throughput of arthroplasty surgery from 396 procedures in 2005–6 to 548 procedures in 2009–10, increased attendance at patient preoperative education sessions from 31 to 81%, decreased length of stay from 6.3 to 5.3 days for hips and 5.8 to 5.3 days for knees, reduced the use of inpatient rehabilitation from 44 to 8% from June 2008</li> </ul>
<b>Australia- South Australia(146)</b>	State (2010)	Various	To deliver efficient and sustainable health care services for the well-being of all patients, as well reduce waiting times for consultation and treatment	<ul style="list-style-type: none"> <li>• The Specialist Outpatient Services Policy Directive was implemented in Australia to reduce inappropriate referrals by standardizing the referral process and giving clinicians a better understanding of who should be referred</li> <li>• Information about best clinical protocols was also provided</li> </ul>	Not reported
<b>Australia – South Australia(6)</b>	State (2010)	Various	To reduce waiting times for consultation and treatment	<ul style="list-style-type: none"> <li>• In 2010-11, The South Australian Government announced that outpatient services in public hospitals would be reformed</li> <li>• As part of these reforms, a standardized state-wide referral form was developed</li> </ul>	<p><i>Grey literature:*</i></p> <ul style="list-style-type: none"> <li>• Through the delivery of the outpatient reform program SA Health has set a savings target of \$5m during the 2013-14 period</li> </ul>

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<ul style="list-style-type: none"> <li>• South Australian Health allocated approximately \$220m to outpatient services</li> </ul>	*Note: impact based on implementation alongside other approaches
New Zealand(147)	Regional (2008)	Orthopedic	To help patients to recover faster and therefore get home sooner after surgery	<ul style="list-style-type: none"> <li>• A group of surgeons, family doctors, allied health staff and nurses, with input from patients, develop standardized electronic referral forms for family doctors were introduced in New Zealand for patients requiring elective hip/knee surgeries</li> <li>• The form includes mandatory fields and open fields where family doctors can provide extra information on the specific patient requirements</li> <li>• This ensures that the hospital has all of the information to make a decision about whether the patient needs to be assessed for surgery</li> <li>• This approach was used in conjunction with other approaches such as pre-rehabilitation and education</li> </ul>	<p><i>Grey literature:</i>*</p> <p>The target to increase the volume of elective surgery by at least 4000 discharges/year has been met at the national level since Oct. 2009.</p> <p>*Note: impact based on implementation alongside other approaches</p>
New Zealand(43)	Regional (2015)	Orthopedic	To standardize referral quality	<ul style="list-style-type: none"> <li>• As part of a new triage process for elective hip and knee referrals, a protocol was developed informing general practitioners (family doctors) and specialists of the information required to facilitate an accurate assessment</li> <li>• This protocol was communicated to all family doctors in Canterbury by hard copy and was posted on the family doctor website</li> <li>• Patients were triaged based on the information in the referral letter and their radiology, according to clinical severity</li> <li>• Failure to comply with the protocol in terms of the requested clinical information and radiological views resulted in a return of the referral letter with an invitation to re-submit when the requested document was provided</li> </ul>	<p><i>Peer-reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• 43% of hip and 54% of knee problems were denied access for a first specialist appointment; most were returned to their family doctor</li> <li>• The triage process was influenced by the surgical capacity of the department and its ability to remain compliant with a maximal 4-month waiting time requirement as determined by the Ministry of Health</li> <li>• Remaining compliant and avoiding financial penalties is one of the driving forces limiting the number of first specialist assessments</li> <li>• This reduction in waiting times for a FSA and subsequent surgery has led to patients with a surgically treatable problem not being assessed and offered a surgical option</li> <li>• The triage process lacked objective scoring. The process was refined over the course of the study; standard of family doctor letters improved</li> <li>• The triage surgeons were able to accurately assess and prioritize the need for surgery</li> </ul>
Switzerland (148)	Hospital (2010)	Various	To identify the expectations of the city doctors; strengthen the link with city medicine, downstream, upstream and during	<ul style="list-style-type: none"> <li>• In 2013, the Hospitaux Universitaires de Geneve (HUG) set up an electronic appointment system enabling city doctors to refer their patients to the various HUG departments</li> </ul>	Not reported

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
			hospitalization; and improve the economics of consultations		
<b>United Kingdom – England(149)</b>	Hospital (Not reported)	Oncology	To reduce wait times	<ul style="list-style-type: none"> <li>• A two-week maximum time was set where all cases of suspected cancer had to be reviewed by specialist services within 2 weeks of a family doctor referral</li> <li>• The 2-week maximum was introduced along with the use of specific Head and Neck referral proformas for family doctors within the catchment area</li> <li>• There was an introduction of the Health and Neck referral proforma for family doctors within the hospital catchment area</li> </ul>	<p><i>Peer-reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• Following introduction of the specific head and neck family doctor referral proforma and the Calman-Hine 2-week rule, a considerable improvement in the intervals encountered by patients with head and neck tumours treated</li> <li>• The overall range of mean waiting times was reduced after the implementation of the two approaches</li> <li>• The categories of improvement were delay in patient presentation to their family doctor; family doctor management; family doctor referral to specialist clinics; specialist clinics to biopsy, FNAC, MRI, CT, chest X-ray, endoscopy, histology result, primary radiotherapy, and surgery</li> </ul>
<b>United Kingdom – England(150)</b>	Pilot (Not reported)	Oncology	To achieve the correct referral urgency, to achieve referral 'straight to test' where appropriate and to achieve referral to the correct specialist (e.g. colorectal surgeon or gastroenterologist)	<ul style="list-style-type: none"> <li>• An electronic referral protocol was conceived with the purpose of handling the whole of the lower gastrointestinal referral process from primary to secondary care</li> <li>• The protocol was available under an electronic referral system</li> <li>• The family doctor, with the patient, fills in the protocol and the destination and referral urgency are given in the final screen page</li> <li>• The family doctor has the option to refer according to the protocol or to override</li> </ul>	<p><i>Peer-reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• Based on 100 patients with colorectal cancer, the electronic referral protocol increased their identification to the TWW* pathway from 43% (based on the traditional referral pathway) to 85%</li> <li>• Based on 100 TWW referrals to the colorectal unit, the electronic referral protocol identified all patients with colorectal cancer to undergo the TWW pathway, upgraded 25 patients into the TWW category, and excluded 27 patients with benign conditions from the TWW category</li> <li>• Based on 100 patients who were referred as routine patients (non-urgent), the electronic referral protocol identified 3 of 4 colorectal cancers and assigned them to the TWW category, upgraded 21 patients into the TWW category, and correctly categorized 69% as routine patients</li> <li>• No wait times for patients using the electronic referral protocol were reported</li> </ul> <p>*TWW refers to the 2-week wait referral (a type of urgent referral indicated for patients with suspicion of cancer) - separate extraction form</p>

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
					** The electronic referral protocol was evaluated not only in terms of its ability to deal with colorectal cancer, but also its ability to address the broad spectrum of other benign conditions such as colitis, irritable bowel, haemorrhoids and fissures.
<b>United Kingdom – England(137)</b>	National (2018)	Various	Not reported	<ul style="list-style-type: none"> <li>• NHS e-Referrals system was implemented in all family doctor practices and hospitals</li> <li>• A new specialist ‘advice and guidance’ option was developed, avoiding the need to default to an outpatient referral</li> <li>• It also embedded decision prompts on local providers with the shortest waiting times, to help with demand/capacity ‘smoothing’</li> </ul>	Not reported
<b>United Kingdom – England(151)</b>	Hospital (2010-2011)	Oncology	To streamline diagnosis for patients with head a neck cancer	<ul style="list-style-type: none"> <li>• As part of a study, the referral process for an oncology service in a single hospital was streamlined through the appointment of a designated coordinator and the introduction of a newly devised proforma</li> <li>• All referrals using the proforma were sent to the coordinator who had access to the head and neck surgical operating schedules</li> <li>• Based on the information at the proforma, a consultant then decided if patients should be scheduled for biopsy, or an appointment to attend the head and neck clinic</li> <li>• Patients scheduled for biopsy were seen on the day of the operation for the informed consent process</li> </ul>	<i>Peer-reviewed literature:</i> <ul style="list-style-type: none"> <li>• Median waiting time from referral to biopsy decreased from 74 to 22.5 days</li> <li>• Mean waiting time from referral to biopsy decreased from 98 to 18 days</li> <li>• The proforma was only used in 29% of cases</li> </ul>
<b>United Kingdom – Scotland(138)</b>	Hospital (Not reported)	Oncology	To enable true skin malignancies to be diagnosed earlier and subsequently treated sooner, as well as reduce the pressure of outpatient clinics	<ul style="list-style-type: none"> <li>• A referral system was established for patients with suspected skin cancers as well as non-malignant symptomatic skin lesions using high quality digital images transferred via a secure electronic referral system (ERS)</li> <li>• family doctors send digital images of skin lesions and suspected skin cancers to the plastic surgery department</li> <li>• The specialist on call screened (triaged) and vetted all referrals received enabling all patients to be assessed within one day</li> <li>• All images were accompanied by a full letter including history, relevant past medical history and current medication</li> </ul>	<i>Peer-reviewed literature:*</i> <ul style="list-style-type: none"> <li>• Results from 300 patients included in the study who underwent the electronic referral system</li> <li>• Mean wait time from referral to diagnosis reduced from 10.9 days (traditional referral system) to 2 days (electronic system)</li> <li>• Mean wait time from diagnosis to treatment was similar between the traditional and electronic system</li> <li>• Mean wait time from referral to treatment reduced from 59 days (traditional) to 28 days (electronic) for urgent cases</li> <li>• Mean wait time from referral to treatment reduced from 126 days (traditional) to 52 days (electronic) for ‘soon’ cases</li> <li>• Mean wait time from referral to treatment reduced from 303 days (traditional) to 65 days (electronic) for routine cases</li> <li>• Mean overall correct diagnosis was 83.2%</li> </ul>

Table S9. Standardized referral forms

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
					<ul style="list-style-type: none"> <li>Total of 90.2% of malignant lesion and 76.6% of benign lesions were correctly identified</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>
United Kingdom – Scotland(83)	Regional (2010)	Orthopedics	To achieve the 18 weeks referral to treatment standard in orthopedics	<ul style="list-style-type: none"> <li>NHS Ayrshire and Arran created referral templates for staff to use instead of letters as a means of making consultant to consultant referrals</li> <li>It was anticipated that these forms would be instantly received and flow smoothly into the receiving department’s electronic referral management process</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>Time taken to vet referrals and appoint patients has dropped from mean of 8 -14 days and a maximum of 56 days, to an mean of 3 – 7 days and a maximum of 14 days</li> </ul>
United Kingdom – Scotland(152)	Regional (Not reported)	Various	To create a robust waiting list management system. This was addressed through electronic referrals	<ul style="list-style-type: none"> <li>There are now electronic referrals being received from NHS Lanarkshire, NHS Lothian, NHS Greater Glasgow and Clyde, NHS Ayrshire and Arran, NHS Dumfries and Galloway and NHS Forth Valley</li> <li>Reconfiguration of electronic referral process has enabled a single point of access, a single waiting list and efficient electronic triage for a core team of AHPs including physiotherapists, occupational therapists, podiatrists and orthoptists</li> </ul>	Not reported
United Kingdom – Scotland(93)	National (Not reported)	Various	Not reported	<ul style="list-style-type: none"> <li>Structured referral sheets were implemented as part of the Planned Care Improvement Programme, which prompt family doctors to conduct any necessary pre referral tests or treatments and educational support by specialists in creation of local referral guidelines</li> </ul>	Not reported

Table S10. Targeted funding

Jurisdiction	Healthcare setting (year implemented)	Description	Impact
<i>Human resource- Increased staff</i>			
<b>Australia - Tasmania(153)</b>	State (2008)	<ul style="list-style-type: none"> <li>Tasmanian Government's \$8.4 million Improving Time to Treatment: Elective Surgery Improvement Plan includes almost \$285,000 to introduce dedicated elective surgery managers in hospitals</li> <li>The North West Regional Hospital employed an additional general surgeon</li> <li>The Mersey Community Hospital employed an additional ophthalmologist</li> </ul>	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>There was a 50% increase in eye surgery at the Mersey Community Hospital through the addition of an ophthalmologist</li> </ul>
<b>Australia- Victoria(154)</b>	Regional (2008)	<ul style="list-style-type: none"> <li>A full-time urologist was appointed resulting in the region to significantly increase OR utilization at the main treatment site, which also enabled the network to commence a urology service from the smaller satellite hospital</li> <li>The appointment of the full-time urologist could be considered the greatest resource that was implemented in this initiative as it provided the best ability for the health service to provide treatment to a larger number of patients</li> </ul>	<i>Peer-reviewed literature:</i> <ul style="list-style-type: none"> <li>The number of patients assessed as 'ready for care' reduced from 579 to 190 (a 67% reduction) and the number of patients classified as 'overdue for surgery' went from 390 to 85 (a 78% reduction)</li> <li>The average waiting time for semi-urgent and non-urgent (Category 2 and 3) patients went from 248 days to 180 days in the 10-month period</li> <li>Because a large number of these patients fall within the DHS defined semi-urgent category and their waiting times still exceeded the recommended 90 days, although a 28% reduction in waiting time is a positive outcome, it still falls below the benchmark required</li> </ul>
<b>Canada- Alberta(155)</b>	Regional (2011)	<ul style="list-style-type: none"> <li>A new orthopedic surgeon has started in the North Zone in July and additional staff have been hired in the Zone to meet target levels</li> </ul>	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>The wait time for knee replacement surgery in Q2 2011/12 was 49.9 weeks which is worse than the prior quarter and the Year to Date (YTD) wait time was 49.2 which is longer than the Alberta target for 2011/12 of 35 weeks</li> <li>The wait time for hip replacement surgery in Q2 2011/12 was 39.7 weeks; slightly better than Q1, but the Year to Date (YTD) wait time was 41.4 weeks, which is longer than the Alberta target for 2010/11 of 27 weeks</li> </ul>
<b>United Kingdom – England(156)</b>	National (Not reported)	<ul style="list-style-type: none"> <li>In England, a Government plan for coronary heart disease was announced in 1999; £50 million was earmarked for extra staff</li> </ul>	<i>Peer-reviewed literature:</i> <ul style="list-style-type: none"> <li>Britain had fewer physicians per capita than Denmark in 1980; numbers increased by only 23% in the subsequent 15 years</li> </ul>
<b>United Kingdom – Scotland(157)</b>	National (2018)	<ul style="list-style-type: none"> <li>The Waiting Times Improvement Plan sets out a range of actions that will deliver major change in access to care - its actions are short term – with clear deliverables at different points over the 30-month timeframe</li> <li>The Scottish Government will invest a total of £535 million on resource and an additional £120 million on capital over the next three years to make a sustainable and significant step-change on waiting times</li> <li>The Plan will initiate investment of £4 million in domestic and international recruitment</li> <li>The Plan will also improve career pathways for key specialties (e.g. advanced nurse practitioners and general nurses) and enhance workforce capacity in urology, dermatology and general surgery</li> </ul>	Not reported
<b>United Kingdom – Scotland(158)</b>	Hospital (Not reported)	<ul style="list-style-type: none"> <li>Extra clinical staff were recruited through the cancer programme</li> <li>An additional breast surgeon was hired to reduce waiting times</li> </ul>	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>Waits for first clinic appointments were reduced to 10 days</li> </ul>
<i>Scheduling- expand outpatient services</i>			

Table S10. Targeted funding

Jurisdiction	Healthcare setting (year implemented)	Description	Impact
<b>Australia- Queensland(101)</b>	State (2017)	<ul style="list-style-type: none"> <li>• The Government invested \$361.2 million over 4 years to provide more specialist outpatient appointments for Queenslanders and to fix known problems in key parts of the patient journey by 2020</li> <li>• Specifically, there would be more surgical appointments so surgical procedures are provided within the clinically recommended time with appropriate follow up by specialists</li> </ul>	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>• By 2017, more patients will be seen within clinically recommended times and current long waits will be reduced</li> </ul>
<b>Australia- South Australia(146)</b>	State (2012)	<ul style="list-style-type: none"> <li>• In 2010-11, the South Australian Government announced that outpatient services in public hospitals would be reformed in order to reduce waiting times for consultation and treatment</li> <li>• During 2012-13, SA Health allocated approximately \$220m to outpatient services</li> </ul>	Not reported
<b>Israel (interview)</b>	National (2017)	<ul style="list-style-type: none"> <li>• Extra money has been paid to specialists to see patients after hours in the community</li> <li>• Program also consisted of funding other activities</li> </ul>	<i>Interview:</i> <ul style="list-style-type: none"> <li>• Program is effective at reducing wait lists</li> </ul>

Table S11. Shared appointments for specialist consultations

Jurisdiction	Healthcare setting (year)	Specialty area	Purpose	Description	Impact
United States(159)	Hospital (Not reported)	General surgery	To improve patients' access to their physicians and improve physician productivity	<ul style="list-style-type: none"> <li>As part of a study, a hospital in Florida implemented shared medical appointments (SMAs) after bariatric surgery</li> <li>There are two main models of SMAs (or group visits): physical examination SMAs and follow-up visits (which do not include a physical examination)</li> <li>Multiple patients meet simultaneously with their healthcare provider(s), and the visits must provide an appropriate standard of medical care</li> <li>Patients also have access to counseling with additional members of a healthcare team, including a behaviorist, nutritionist, or health educator, and benefit from the experiences and advice of other patients</li> <li>The patients and the medical team are obligated to confidentiality</li> <li>Patient encounters are billed as individual visits and are coded according to the level of care; the patients are not billed for the total time of the SMA visit, because the patient only has the individual attention of the physician for several minutes</li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>Of the patients who initially participated in a SMA, 91% scheduled a subsequent SMA and 96% indicated they would recommend SMAs to others</li> <li>On a scale of 1-5 (1, poor and 5, excellent) patients graded their overall experience with SMAs as 4.5</li> <li>There was a statistically significant decrease in the average waiting period for an appointment for new patients</li> <li>There was also a statistically significant decrease in the average waiting period for former patients</li> <li>To ensure physician productivity and better access to follow-up visits, the number of patients seen in the SMA should be larger than the number of patients seen during the same period through individual appointments (e.g. 15 patients within a 90 minute session)</li> </ul>
United States(160)	Clinic	Orthopedic	To increase access to care without increasing cost	<ul style="list-style-type: none"> <li>As part of a study, SMAs were implemented at a clinic providing nonsurgical and surgical care options for atraumatic and traumatic disorders of the hand in a teaching environment at an urban hospital in New Jersey</li> <li>SMAs were implemented for patients with hand pain</li> <li>Group visit staffing was the same as for the traditional visit: hand surgeon, nurse practitioner, orthopedic technician, medical student, and medical assistant</li> <li>Each clinical session consisted of four 1-hour, consecutive group visits scheduled once a month on a Monday morning (traditional office visit clinic was scheduled on the other 3 Mondays in the month)</li> <li>Up to 10 people could be scheduled for each 1-hour group visit and patients signed a confidentiality agreement at check-in</li> <li>The group visits began with a 10-minute educational session and group discussion led by the hand surgeon</li> <li>Time is allowed for questions and experiential sharing is encouraged</li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>SMAs are capable of increasing patient access to care and effectively handling increased patient volume with room for cost-effective growth in the future, all while maintaining quality of care</li> <li>Access (time to appointment) was improved in the group visit model</li> <li>The authors anticipate group visits dedicated specifically to carpal tunnel syndrome or hand arthritis; this will allow each group to be more focused and will streamline education and mutual support among the patients</li> </ul>

Table S11. Shared appointments for specialist consultations

Jurisdiction	Healthcare setting (year)	Specialty area	Purpose	Description	Impact
				<ul style="list-style-type: none"> <li>• A medical assistant entered the chief complaint using an electronic standardized questionnaire into the EMR along with basic vital signs for each patient either prior to, during, or after the group presentation</li> <li>• After the group educational session, patients transition to a large, open clinical room with 6 separate workstations (workstations in the open clinical room allowed for greater efficiency as providers can easily transition to other tasks from one workstation to another during time that may have been spent waiting for other team members in the more linear, traditional clinic)</li> <li>• Small procedures were performed on the table (suture removal, dressing changes, injections)</li> <li>• Patients could see the clinicians in a private exam room if they wish or require</li> <li>• In the group visit, major tasks are performed simultaneously by advance practice providers (nurse practitioners, physician assistants) in conjunction with supervision of the attending physician</li> </ul>	

Table S12. Standardized treatment pathway

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
Canada-Alberta(11, 103, 139)	Pilot (2005) Provincial (2010)	Orthopedic	To reduce lengthy waiting times for consultation and surgery and to improve care for patients	<ul style="list-style-type: none"> <li>• In 2003-04, the Alberta Orthopedic Society (AOS) undertook an initial comprehensive analysis and redesign of the continuum of care for hip and knee replacement in an effort to reduce lengthy waiting times for consultation and surgery and to improve care for patients</li> <li>• The work comprised all components of the continuum: referral, patient assessment by a specialist including a treatment plan for non-surgical patients, patient optimization, surgery, inpatient care, sub-acute care, recovery at home and ongoing monitoring</li> <li>• All services, other than family doctor and in-hospital, are provided in or through a hip and knee clinic               <ul style="list-style-type: none"> <li>- Care is fully integrated, provided by a multidisciplinary team and coordinated by a case manager in the clinic</li> <li>- Surgeons, nurses, and physiotherapists are involved in the care of the patient from consultation through to surgery and back into the community</li> </ul> </li> <li>• Patients have the choice of first available surgeon or a specific surgeon</li> <li>• The addition of specific criteria was intended to reduce non-evidence based medical screening that is costly and consumes public health care resources</li> <li>• The new continuum applied evidence-based criteria to patient referral for home care following surgery</li> <li>• Evidence-based criteria were also applied when considering patient transfer to sub-acute care following surgery in the new continuum</li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• In the pilot study, patients who followed the new care path had significantly greater improvement in general health, less pain after surgery, and greater ability to perform normal daily activities than those who received conventional care</li> <li>• Waiting times from referral to first consultation and consultation to surgery decreased dramatically</li> <li>• LOS decreased by 1.3 days</li> <li>• The number of patients mobilized the day of surgery increased significantly (31 to 85%)</li> <li>• The degree of improvement among patients in the new continuum of care exceeded that of patients in the conventional approach as measured by the WOMAC and SF-36</li> <li>• Patients in the new continuum of care had a 36% improvement in their average WOMAC score, compared with a 31% improvement for patients in the conventional approach</li> <li>• The lower total cost to public health care together with improved patient outcomes indicate the new continuum is more cost-effective than the conventional approach to hip and knee replacement</li> <li>• Results of the pilot suggested that the new continuum can achieve a standard for consultation waiting time of 17 working days or less on average by eliminating the backlog of patients and providing sufficient central intake resources</li> <li>• Alberta can achieve significantly higher standards in wait times in the two major components of access – consultation and surgery – through improved processes and better allocation of health care resources</li> <li>• Reduced LOS could be due to adherence to the new continuum’s target length of stay, to improved patient optimization prior to surgery, or to a combination of these two factors</li> </ul> <p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>• The Hip and Knee Replacement Program has reduced the time between the decision to have surgery and the surgery date to 19.2 weeks, down 12% or almost 3 weeks from when the program launched in 2010</li> <li>• The average hospital stay for hip and knee patients has been reduced from 4.9 days for hip replacements and 4.6 days for knee replacements, to 4.1 days for both</li> </ul>

Table S12. Standardized treatment pathway

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
					<ul style="list-style-type: none"> <li>• Almost all patients returned to normal function for their age, indicating no ill effects from the shorter hospital stay</li> <li>• The patient satisfaction rate has increased from 86% to 98%. Rate of hospital readmission following surgery, already low at 4.3%, has improved even further to 4.1%</li> <li>• Reductions in length of hospital stay have freed up about 33,000 days of hospital bed space since 2010, enabling AHS to perform more than 1,600 additional hip and knee surgeries with the same bed capacity</li> </ul>
Canada-Ontario(161)	Regional (2013)	Cardiothoracic	Not reported	<ul style="list-style-type: none"> <li>• The Hamilton Niagara Haldimand Brant LHIN implemented the Integrated Cardiac Program, which operates across multiple sites and is led by a single medical director</li> <li>• Includes standardized referral and patient care processes that provide evidence-based care</li> <li>• Sites share policies, procedures and protocols, including common clinical policies, procedures, admission and discharge criteria</li> <li>• They also share common quality of care monitoring, reporting and identification with a commitment to joint monitoring of quality performance indicators</li> </ul>	Not reported
Canada-Saskatchewan(36-38)	Provincial (2010)	Orthopedics/ neurosurgery (spine)	To improve quality for lower back pain care by encouraging guidelines-concordant evidence-based primary care while reducing wait times for appropriate MRI and surgical referral	<ul style="list-style-type: none"> <li>• The Saskatchewan Spine Pathway, a standardized assessment and treatment process, was implemented for patients with low back pain</li> <li>• The Pathway is intended to support treatment of patients by family doctors in their communities</li> <li>• However, patients with “red flags” or those who do not improve with recommendations outlined in the pathway are referred to Spine Pathway Clinics</li> <li>• These clinics are multi-disciplinary and have centralized referral, triage and assessment, and pooled waiting lists</li> </ul>	<p><i>Peer reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• In a retrospective analysis of 215 consecutive new patient referrals between June 1, 2011 and May 30, 2012, it was reported that SSP clinic referrals were significantly more likely to be candidates for surgery than referrals from outside an SSP clinic (59.1 vs. 37.6%, p=0.003)</li> </ul>
Canada-Saskatchewan(39)	Provincial (Not reported)	Orthopedic	Not reported	<ul style="list-style-type: none"> <li>• The Saskatchewan hip and knee pathway was implemented for patients with hip and knee osteoarthritis who may need joint replacement surgery</li> <li>• All patients are referred to a multi-disciplinary clinic where they are assessed and care options are discussed</li> <li>• The clinics offer a standard patient assessment process; provide consultations with an experienced health care team dedicated to improving patients’ quality of life and health; confirm patients’ need for surgery and provide surgical consults and surgical bookings (if patient is a surgical candidate); provide</li> </ul>	Not reported

Table S12. Standardized treatment pathway

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<p>faster referral to specialists and surgeons; provide patient education, educational sessions, and take-home information to prepare patients for surgery; follow up with patients after surgery to speed recover; and offer access to community partners, other health professionals, and ongoing follow-up and support</p> <ul style="list-style-type: none"> <li>• When surgery is not the preferred option, the clinics also help patients access non-surgical care in the community</li> <li>• Clinics are located in multiple cities across the province (Saskatoon, Regina, Prince Albert, and Moose Jaw)</li> </ul>	
<b>New Zealand (interview)</b>	National (Not reported)	Orthopedic	Not reported	<ul style="list-style-type: none"> <li>• District Health Boards have integrated clinical pathways, which include nonsurgical management prior to referral</li> <li>• If a referral is made, the patient is assessed by a specialist and if they do not meet the threshold, primary care resumes management</li> <li>• If a patient is not accepted for surgery, they are returned to the family doctor with a plan of care</li> </ul>	Not reported
<b>Norway(44)</b>	Hospital (2008)	Various	To reduce cancellation rates for surgery	<ul style="list-style-type: none"> <li>• An elective surgery pathway has been established for patients receiving elective surgery at Forde Hospital day surgery centre</li> <li>• The pathway includes centralized referral and pre-admission, patient choice of first available surgeon, patient choice of date of surgery, and a capacity coordinator to manage the program across all departments</li> <li>• A data management system is in place provide an overview of referrals, waiting lists, and surgery schedules across all departments</li> </ul>	<p><i>Peer-reviewed literature:</i></p> <ul style="list-style-type: none"> <li>• Mean cancellation rate was reduced from 8.5% to 4.9% (p&lt;0.001)</li> <li>• Median number of operations performed per month increased 17%</li> <li>• Median number of scheduled operations per month increased from 373 to 400 (p=0.04)</li> </ul>
<b>United Kingdom-England(45)</b>	Not reported	Various	Not reported	<ul style="list-style-type: none"> <li>• One approach of referral management is passive use of referral protocols and electronic decision-support tools that describe care pathways</li> </ul>	<p><i>Grey literature</i></p> <ul style="list-style-type: none"> <li>• Systematic reviews have shown that referral guidelines can be effective in changing referral behaviours if combined with feedback from peers and/or specialists”</li> </ul>

Table S13. Wait time targets

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/ implications
<b>Policy: Legally binding wait time targets or guarantees enforced through positive and negative incentives</b>					
<p><b>United Kingdom- England (2000-2008) (107, 162-174)</b></p>	<p>Cancer: 2000: 2 weeks from family doctor referral to specialist assessment</p> <p>Non-cancer: 2000: 18 months for inpatient treatment</p> <p>2002: 26 months from referral to specialist 15 months for inpatient treatment</p> <p>2003: 21 months from referral to specialist 12 months for inpatient treatment</p> <p>2005: 3 months from referral to specialist 6 months for inpatient treatment</p> <p>2008: 18 weeks from referral to start of treatment</p> <p>The “star rating” system was introduced as a measure of institutional performance, and includes wait time considerations.</p>	<p>Implementation level: National</p> <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> <li>• The guarantee covered procedures funded by the public system</li> <li>• Initially, two separate guarantees were given to patients: one from referral to first specialist consultation, and another that covered inpatient waiting time.</li> <li>• Penalties were applied to hospitals with poor performance. <ul style="list-style-type: none"> <li>– Jobs of senior executives were under threat if performance was poor.</li> </ul> </li> <li>• Rewards were also given to hospitals that performed well in the form of greater autonomy.</li> <li>• Wait time data were published at the hospital level.</li> </ul>	<ul style="list-style-type: none"> <li>• A major increase in funding was provided during this time</li> <li>• Department of Health funded London Patient Choice Project (LPCP), in which patients at risk of breaching inpatient waiting time targets were offered the choice of an alternative hospital with a shorter wait.</li> <li>• Department of Health also set up overseas commissioning, which allowed hospitals to send their patients abroad to receive surgery so that Trusts could reach targets and avoid breaches.</li> </ul>	<p>Trends based on census data showed that during sanctions, fewer people waited more than 6 months for treatment. The median waiting time after patients were added to the waiting list was also shorter.</p> <p>A comparison of wait times before and after 2001 between England (which adopted an aggressive wait time targets policy coupled with strong sanctions for poor performing hospitals) and Scotland (which did not adopt the same policy) concluded that the proportion of patients waiting longer than 6 months for treatment fell by 6 to 9% points more in England than in Scotland and admissions for elective care increased. The order in which patients were treated did not appear to change, nor did the proportion of urgent cases fall. Further, there was no change in the severity of patients admitted for treatment or the quality of care patients received (based on the outcome measures assessed). However, there was evidence of waiting list manipulation, since the number of ‘suspensions’ (patients deemed not medically ready for treatment or could not attend first appointment date) and ‘removals’ (patients who died or were treated elsewhere) from the waitlist increased.</p> <p>Wait times were compared for breast cancer treatment before (1997-1999) and after (1999-2000) implementation of targets. The mean wait time from family doctor to specialist fell from 13.6 days to 12.3 days (p&lt;0.001). However, the mean wait times from specialist to treatment (not covered under the guarantee at this time) increased from 21.4 days to 24.1 days (p&lt;0.001). The mean wait time from family doctor to treatment increased from 35 days to 36.4 days (p=0.01).</p> <p>A duration analysis of wait time data from 2001/2002 and 2002/2003 for general surgery, orthopedics and ophthalmology</p>	<p>Overall findings are based on analysis of the outcome before and after implementation of wait time target policies. However, many other approaches were in place along with the wait time target policy. Thus, it is not possible to conclude that the observable impact was only attributable to the wait time target policy.</p>

Table S13. Wait time targets

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/implications
				<p>found that variations in probabilities of admission coincided with changes to targets.</p> <p>Wait times were compared in England, Wales and Northern Ireland between 2001 and 2003. While they improved in England, they deteriorated in Northern Ireland and Wales, where the wait time target policies were not implemented.</p> <p>A before-after comparison of waiting time distributions for elective orthopedic surgeries in English hospitals found that the introduction of the wait time target changed admission patterns and led to an overall reduction in long waits. Admissions increased for all wait time categories except the shortest one.</p> <p>The mean waiting time from decision to treat to joint replacement fell from 157 days to 88 days (<math>p &lt; 0.001</math>) between 2006 and 2009. There was no evidence of socioeconomic disparities as the mean waiting time was 121 for the 20% less deprived and 119 days for the other groups. However, the mean “work-up waiting time” increased from 429 days to 487 days (<math>p = 0.07</math>). Work up waiting time was defined as time from first referral to orthopedics clinic in the 3 years prior to surgery to inclusion in the waiting list.</p> <p>The policy faced criticism among healthcare professionals, e.g., mis-prioritization, undermined professional autonomy and “professionalism”</p> <p>Based on the results of a study exploring the effect of the LPCP on ophthalmology waiting times using ‘difference in difference methods’, the Project reduced both waiting times and variation in waiting times across London hospitals.</p> <p>A study comparing patients who travelled abroad for total knee replacement surgery through the overseas commissioning policy</p>	

Table S13. Wait time targets

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/ implications
				<p>with those who were treated locally found that while functional outcomes were comparable, the overseas group were more dissatisfied with their overall experience</p> <p>Low and high performing trusts based on the star rating system were compared to explore the impact of such a system. Through semi-structured interviews with senior executives and document analyses, it was found that while the system drove some beneficial change, it also led to “tunnel vision, a distortion of clinical priorities, bullying and intimidation, erosion of public trust, and reduced staff morale”.</p>	
<b>Policy: Legally binding wait time targets or guarantees and mandatory offer of alternative provider enforced through negative or positive incentives</b>					
<p><b>United Kingdom- England (2011-current) (162, 166, 175, 176)</b></p>	<p>2011: Cancer: 2 weeks from family doctor referral to specialist 31 days from diagnosis to surgery 62 days from family doctor referral to first treatment</p> <p>Non-cancer: 18 weeks from referral to start of treatment</p>	<p>Implementation level: National</p> <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> <li>• The guarantee covers the whole patient journey from referral to initial treatment.</li> <li>• By law, patients are given options of other providers (public or private) if guarantee cannot be fulfilled.</li> <li>• NHS also sets operational standards in which at least 90-95% of patients have to start treatment within 18 weeks of referral.</li> <li>• Providers are monitored on a monthly basis and breach of the operational standard will result in up to 5% reduction in revenue</li> </ul>		<p>Interviews with family doctors, oncologists and surgeons about wait time targets for colorectal cancer were conducted. Overall, they were positive about the targets. However, the following concerns were raised: wait time targets took a ‘one-size fits all’ approach; providers faced considerable pressure; and waiting time targets over-rode patient and provider choice.</p>	<p>Overall findings are based on analysis of outcomes before and after implementation of wait time target policies. However, many other approaches were in place along with the wait time target policy. Thus, it is not possible to conclude that the observable impact was only attributable to the wait time target policy.</p>
<p><b>Sweden (2010) (162, 177-179)</b></p>	<p>Patients to have instant contact with the health care system (0 days) Patients to be seen by family doctor within 7 days and by a specialist within 90 days*</p>	<p>Implementation level: National</p> <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> </ul>		<p>A comparison of wait times for bariatric surgery in Sweden and Norway showed that the median waiting time from referral letter received to bariatric surgery was 253 days in Sweden and 461 days in Norway (where</p>	-

Table S13. Wait time targets

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/implications
	<p>Patients to wait no more than 90 days after being diagnosed to get treatment No rationale for the wait time targets were found.</p> <p>* The Stockholm County Council had established more aggressive targets where patients were guaranteed consultation with a specialist within 30 days</p>	<ul style="list-style-type: none"> <li>• The guarantee covers patients from first contact with the health care system to surgery</li> <li>• By law, patient can choose another provider (public or private) if the guarantee was not fulfilled. Expenses would be covered by their home province</li> <li>• An economic incentive was introduced in 2009 (Queue Billion programme). Money was given to counties that reached the wait time targets set out in agreements.</li> </ul>		<p>guarantees were enforced for a targeted population and only if a patient files a complaint). However, the numbers of operations in private hospitals in 2016 were 2,240 in Sweden and 114 in Norway. 55% of operations in the private sector were paid by the Swedish Government, whereas 0% of operations in the private sector were paid by the Norwegian Government.</p>	
<p><b>Policy: Legally binding wait time targets or guarantees and mandatory offer of alternative provider</b></p>					
<p><b>United Kingdom- Scotland (2011-current) (158, 162, 180-183)</b></p>	<p>Cancer: 31 days from decision to treat to first treatment 62 days from referral to treatment</p> <p>Coronary heart disease: 16 weeks from referral to cardiac intervention.</p> <p>Other elective care: 12 weeks from specialist decision to treat to treatment 18 weeks from referral to treatment 6 weeks for eight diagnostic tests</p>	<p>Implementation level: National</p> <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> <li>• The guarantee covers the whole patient journey from referral to initial treatment.</li> <li>• By law, if the guarantee is not fulfilled, the Board must provide a written explanation to the patient.</li> <li>• Patients can be given the option of treatment elsewhere (private or public).</li> <li>• There are also operational standards in which, for example, 90% of patients have to start treatment within 18 weeks of referral.</li> <li>• Performance of regions is reported in the press, but currently it is unclear</li> </ul>	<p>Not reported</p>	<p>Not reported</p>	<p>Not reported</p>

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/implications
		what sanctions are in place if operational standards are not met.			
<b>Policy: Non-legally binding wait time targets or guarantees and offer of alternative provider</b>					
<b>Denmark (1993) (162, 184)</b>	1993: 12 weeks from family doctor or specialist referral to beginning of treatment	Implementation level: National <ul style="list-style-type: none"> <li>• Patients were given the option of treatment at any public hospital</li> <li>• Expenses would be covered by the public system.</li> <li>• Patients were not reimbursed for travel expenses. (288;332)</li> </ul>	“Extra funds allocated”	There was no effect on waiting times	A new policy was in place in 2002
<b>Denmark (2000-2011) (162, 184)</b>	2000: Maximum wait time for life-threatening conditions established 2002: 8 weeks from family doctor referral to beginning of treatment 2007: 4 weeks from family doctor referral to beginning of treatment 2011: Non-cancer: 4 weeks from family doctor referral to diagnosis Non-cancer and non-life threatening conditions: 4 to 8 weeks (depending on urgency) from diagnosis to beginning of treatment Cancer: 2 weeks from referral to specialist 2 weeks from diagnosis to surgery 4 weeks from referral to follow-up treatments Ischemic diseases: Unstable angina pectoris: 3 weeks from specialist to coronary arteriography and revascularisation Angina pectoris after MI: 5 weeks from specialist to revascularisation and coronary angiography	Implementation level: National 2002: <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> <li>• The guarantee covered patients from referral to treatment</li> <li>• Patients were given the option of treatment from another provider (public or private) if the guarantee was not fulfilled. Expenses would be covered by the public system.</li> <li>• Patients were not reimbursed for travel expenses.</li> </ul>	In 2002, an additional 1.5 billion DKK were pledged to surgical activity to increase it by 14-18%	One report concluded that waiting times declined after 2002, although other approaches were already in place during this time (162) and the number of patients using private hospitals increased from 2.0% in 2006 to 4.2% in 2008.	Not reported
<b>United Kingdom- Scotland (2003-2007) (107, 158, 162, 181-183, 185-188)</b>	2003: 9 months from referral to first specialist assessment 9 months from specialist decision to treat to treatment 2005:	Implementation level: National <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients without an Availability Status Code (ASC, assigned to patients who</li> </ul>	Not reported	Overall, there was a reduction of waiting times after the implementation of the policy. But the decrease in waits for some patients was at the expense of other patients who would have waited less if the policy was not in place. Further, data was potentially manipulated (gaming) as the number of the	The ASC code was abolished in 2007.  Overall findings are based on analysis of outcomes before

Table S13. Wait time targets

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/implications
	<p>6 months from referral to first specialist assessment 6 months from specialist decision to treat to treatment</p> <p>2007: 18 weeks from referral to first specialist assessment 18 weeks from specialist decision to treat to treatment</p>	<p>were not available or suitable for treatment).</p> <ul style="list-style-type: none"> <li>• Two separate guarantees were given to patients: one from referral to first specialist consultation, and another that covered inpatient waiting time.</li> <li>• NHS boards were monitored on a monthly basis. Individual “breaches” had to be reported to the Executive and were rigorously investigated.</li> <li>• Patients at risk of breaching the target could be diverted to a national waiting centre dedicated to elective surgeries.</li> </ul>		<p>allocation of ASC code to patients increased during this period</p> <p>The mean waiting time from specialist to initial treatment decreased from 84.1 days to 74.9 days from 2003/04 to 2005/06. The median waiting time increased from 44 days to 49 days. However, at the 90<sup>th</sup> percentile, the waiting time decreased by 59 days. Further analysis showed that patients in the low priority group experienced an 11% (16 days) reduction in mean waiting time relative to the high priority group, whose waiting times did not change over time.</p> <p>Mean waiting time from specialist to treatment reduced from 79.4 days to 63.0 days from 2002 to 2007. Further analysis showed that waiting times decreased for patients with longer times at the expense of those who previously waited less.</p> <p>In the orthopedic surgery department of one Health Board, the 95 percentile wait decreased from 36 weeks in 2004 to 17 weeks in 2007.</p> <p>Wait time reductions after 2001 were compared between England and Scotland (where, at that time, waiting time targets were not strongly monitored). The proportion of patients waiting longer than 6 months for treatment fell by 6% to 9% more in England than Scotland. The study also reported that the percentage of patients waiting more than 6 months for care was 14% in those with the ASC code and 28% for those patients in Scotland without the ASC code</p>	<p>and after implementation of wait time target policies. However, many other approaches were in place along with the wait time target policy. Thus, it is not possible to conclude that the observable impact was only attributable to the wait time target policy.</p>
<p><b>Sweden (1997) (162)</b></p>	<p>1997: Patients to have instant contact with primary care (0 days) Patients to be seen by family doctor within 7 days and consulting a specialist within 90 days</p>	<ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> <li>• The guarantee covered from physician’s decision to treat to surgery</li> <li>• Patient could choose another provider (public</li> </ul>	<p>Not reported</p>	<p>No information found</p>	<p>Not reported</p>

Case examples	Wait time targets	Wait time target policy	Other information	Impact of policies	Consequences/implications
		or private) if the guarantee was not fulfilled. Expenses would be covered by their home province.			
<b>Sweden (2005) (162, 177-179, 189, 190)</b>	<p>2005:</p> <p>Patients to have instant contact with the health care system (0 days)</p> <p>Patients to be seen by family doctor within 7 days and consulting a specialist within 90 days*</p> <p>Patients to wait no more than 90 days after being diagnosed to get treatment</p> <p>No rationale for the wait time targets were found.</p> <p>*The Stockholm County Council had established more aggressive targets where patients were guaranteed consultation with a specialist within 30 days</p>	<p>Implementation level:</p> <p>National</p> <ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients (but it was not a legal right)</li> <li>• An agreement was signed between the Federal Government and the county councils (although no legislation was implemented)</li> <li>• The guarantee covered patients from first contact with the health care system to surgery</li> <li>• Patient could choose another provider (public or private) if the guarantee was not fulfilled. Expenses would be covered by their home province.</li> </ul>	<p>Additional funding was provided extra funding to support the wait time target policy. The amounts were SEK 700 million in 2005, an additional SEK 500 million in 2006, and SEK 750 million in 2007. This was equivalent to 0.3% of the health care budget in 2005.</p>	<p>Data from the National Cataract registry showed that mean waiting times for cataract surgery decreased from 2005 (5 months) to 2008 (2.3 months). The number of patients crossing borders to have operations in another province went from 5% (2005) to 3% (2008). The mean waiting time for people who moved was 2.0 months, whereas the time for those who did not move was 3.4 months (<math>p &lt; 0.001</math>).</p> <p>Overall, waiting times decreased from 2005 to 2007. However, in 2008, 30% of all patients on the waiting lists had been waiting more than 90 days for an appointment with specialist. Also, there was a wide variation in wait times among regions. The general conclusion was that “the guarantee had a limited impact on waiting times, suggesting that implementation of the reform had not been completely successful”.</p>	<p>Changes in the policy were introduced in 2010. Reasons were that policy had limited effect on wait times and many authorities did not inform patients and providers about the guarantee.</p>
<b>Policy: Non-legally binding wait time targets or guarantees</b>					
<b>Canada- Alberta (Five year action plan 2010-2015)(191)</b>	<p>30 days from referral to specialist</p> <p>Cancer: 4 weeks from referral to treatment</p> <p>CABG: 1 to 16 weeks from referral to treatment</p> <p>Other surgical procedures: 14 weeks from referral to treatment</p>	<p>Implementation level:</p> <p>Provincial</p> <p>A five year action plan set targets to specific surgical procedures</p>	<p>The targets were set under a 5-year Health Action Plan (2010-2015)</p>	<p>Not reported</p>	<p>Not reported</p>

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
				<ul style="list-style-type: none"> <li>• The WTIS was established to assist with the management of wait times at the LHIN, hospital, and surgeon level</li> <li>• It provides near real-time wait times data for surgery (waits 1 and 2), diagnostic imaging, and alternate level of care (ALC)</li> <li>• Hospitals have wait time coordinators who are responsible for collecting data and training clerks in physicians' offices on data entry and look for issues that need to be addressed at the hospital level(105)</li> <li>• DARTS are used to report periods of unavailability due to patient reasons and remove them from the measured wait time (DART refers to periods of time between decision to treatment and the procedure date when the patient is unavailable for procedure(105)</li> <li>• The WTIS is managed by Cancer Care Ontario, who reviews the wait time information, analyzes patterns/trends, and provides recommendations to the Ministry, LHINs, and hospitals</li> </ul>	<ul style="list-style-type: none"> <li>• The process is very collaborative so recommendations make sense to everyone</li> </ul>
<b>Canada- Ontario (interview)</b>	Regional (Not reported)	Orthopedic	Not reported	<ul style="list-style-type: none"> <li>• The Champlain Regional Orthopedic Network measures "wait 1a" (wait from family doctor referral to central intake), "wait 1b" (wait from assessment to first consultation with surgeon), and "wait 2" (wait from decision to treat to surgery)</li> <li>• Using this information, the Network provides advice to the LHIN regarding distribution of services, where services should be offered, volume allocation, funding, etc.</li> </ul>	Not reported
<b>New Zealand (interview)</b>	National (Not reported)	Various	Not reported	<ul style="list-style-type: none"> <li>• Eight key performance indicators are measured and monitored in each district health board (DHB)</li> <li>• The indicators are:                             <ul style="list-style-type: none"> <li>- DHB services that appropriately acknowledge and process patient referrals within required timeframe</li> <li>- Patients waiting longer than the required timeframe for their first specialist assessment</li> <li>- Patients waiting without a commitment to treatment whose priorities are higher than the actual treatment threshold</li> <li>- Patients given a commitment to treatment but not treated within the required timeframe</li> <li>- Patients in active review who have not received a clinical assessment within the last six months</li> <li>- The proportion of patients treated who were prioritised using nationally recognised processes or tools</li> </ul> </li> </ul>	Not reported

Table S16. Regular validation of wait lists

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Wait list validated	Description	Impact
Australia- South Australia(6, 198)	Regional (2013) State (2017)	Various	To provide more accurate information for family doctors	Consultation	<ul style="list-style-type: none"> <li>In 2013, a regional authority implemented the approach where a team was in charge of a process of checking with patients and their family doctors on the outpatients waiting list to determine if they had either been seen elsewhere or no longer needed appointment</li> </ul>	<p><i>Grey literature:</i>*</p> <ul style="list-style-type: none"> <li>According to an annual report from 2013/14, the number of outpatient occasions of service (any service provided to a patient) reduced by 4% from 2013 to 2014 in the Southern Adelaide Local Health Network</li> <li>According to an anecdote from a media release the time from referral to specialist for renal patients at one hospital was reduced by 93% after expansion of the approach to the state level (mean wait of 594 days before approach to 41 days after approach)</li> </ul> <p>*Note: impact based on implementation alongside other approaches</p>

Table S17. Web-based specialist directories

Jurisdiction	Healthcare Setting (year)	Purpose	Specialty area	Description	Impact
<b>Australia- Queensland(101)</b>	State (2018)	Various	To reduce the number of patients waiting longer than clinically recommended for initial specialists' appointments	<ul style="list-style-type: none"> <li>An integrated online directory was established within the Smart Referrals program (an electronic referral system) providing family doctors with access to real-time information about where they can refer their patients and how long the wait time is</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>The directory is seen as an investment for improvements in the patient journey</li> <li>The system provides an easy and convenient way for family doctors to track referral and ensuring that nothing gets lost or duplicated</li> <li>It is expected that this process will lead to improved safety and quality of care, workflow efficiency, patient experience, family doctor experience, clinician experience, and financial benefits</li> </ul>
<b>Canada- Alberta(199)</b>	Provincial (Not reported)	Various	To reduce patient wait times, reduce work load burden, save time, reduce operating costs and improve patient satisfaction and safety	<ul style="list-style-type: none"> <li>The Alberta Referral Directory was established to provide information about service and consultant demographics, referral guidelines, referral forms and detailed instructions to facilitate referral acceptance without delay</li> <li>With Connect Care, providers will be able to easily access the ARD when making referrals</li> <li>Information listed in Consultant Profiles originated from the College of Physicians and Surgeons of Alberta (CPSA) and the Alberta Health Provider Registry</li> <li>Profiles were updated by consultants and/or their delegates to include areas of specialty, site services performed at, associated services, contact information, languages spoken, etc.</li> <li>Private services were also listed by completing a service request form</li> <li>Service Editors were encouraged to update their profiles to include referral guidelines (reasons for referral, required tests/ investigations and information), referral processes and forms, approximate routine wait times and eligibility requirements, and communication turnaround targets</li> </ul>	Not reported
<b>Canada- British Columbia(200)</b>	Regional (2017)	Various	To streamline the referral process	<ul style="list-style-type: none"> <li>Fraser Northwest Division of Family Practice developed a web-based directory called Pathways for family doctor to specialist referrals</li> <li>After a successful pilot, the program was expanded to all family doctors and specialists within Vancouver Division of Family Practice</li> </ul>	<p><i>Grey literature:</i></p> <ul style="list-style-type: none"> <li>As of July 2017, the directory had 3723 specialists and 970 clinics listed</li> <li>New resources and forms have been continually added for improvement</li> <li>94% of Division members have implemented Pathways within their settings</li> <li>As of August 2017, the patient was integrated in the directory and is able to receive email communication</li> </ul>

Table S17. Web-based specialist directories

Jurisdiction	Healthcare Setting (year)	Purpose	Specialty area	Description	Impact
					<ul style="list-style-type: none"> <li>• Due to the success of the implementation, a full province-wide implementation was expected by mid-2018</li> <li>• Web-based directories have allowed for all information and interactions to occur in one place and thus minimizing the possibility of missed referral</li> </ul>
<b>Canada- Manitoba (interview)</b>	Provincial (Not reported)	Not reported	Not reported	<ul style="list-style-type: none"> <li>• The province implemented an online catalogue for specialists, showing what each specialist does and/or does not do</li> </ul>	<i>Interview:</i> <ul style="list-style-type: none"> <li>• Catalogue was dependent on specialists self-updating their data, which was difficult to manage and ultimately not successful</li> </ul>
<b>Canada- Quebec(35)</b>	Provincial (2016)	Various	To streamline the referral process between general practitioners and specialists	<ul style="list-style-type: none"> <li>• A web-based directory was developed alongside Montreal's Service Request Distribution Center (CRDS)</li> <li>• family doctors were required to register in the directory to use the distribution centre</li> </ul>	Not reported
<b>Canada- Saskatchewan(201, 202)</b>	Provincial (2010)	Various	Various To improve experiences for surgical patients and to reduce the wait times of patients waiting for a surgery	<ul style="list-style-type: none"> <li>• A patient referral guide website was developed so family doctors can access information about specialists and their practice</li> <li>• family doctors can select the most appropriate specialist for the patient</li> <li>•The directory provides real-time information about the specialist' wait times so patients can choose how long they would like to wait to see a particular specialists</li> </ul>	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>• Number of patients waiting over 18 months was reduced by 57%</li> <li>• Number of patients waiting over 12 months was reduced by 37%</li> <li>• Year one target was not met due to various factors</li> <li>• The directory is able to help patients and family doctors make the best choices for care.</li> <li>• Although, the set targets have been seen as challenging, the goal is to continue working on them and to allow sufficient time to accomplish the goals</li> </ul>

Table S18. Appointment reminders for consultation

Jurisdiction	Healthcare Setting (year implemented)	Specialty area	Purpose	Description of Service	Impact
United Kingdom - Northern Ireland(61, 203)	National (2017/18)	Various	To reduce no-show appointments, which lead to longer wait times as those appointment spots are not filled with patients requiring care	• Health and Social Care Trusts implemented text and voice messaging services to remind patients of their upcoming appointments	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>• Report shows that there was a decrease in missed appointments from 2013/14 at the rate of 10.3% to 2015/16 at the rate of 8.3%</li> <li>• The text and voice service has contributed to the decrease of missed appointments</li> <li>• If the service is provided on a regional basis it might lead to higher improvements</li> </ul>

Table S19. Cancellation lists

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Description	Impact
Canada- Alberta (interview)	Surgeon-specific	Not reported	• Some surgeon’s offices have implemented a cancellation list, where patients on the list can receive consultations or surgeries on short notice (after another patient cancels).	Not reported

Table S20. No-show policies

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
Canada- Newfoundland(204)	Provincial (2016)	Various	To discourage no-show appointments	<ul style="list-style-type: none"> <li>• Regional Health Authorities in Newfoundland have implemented a no-show policy</li> <li>• Patients who miss an appointment or who don’t cancel with sufficient notice (at least 48 hours) will be required to obtain another referral letter or an update referral from their physician in order to get a new appointment</li> <li>• Exceptions included family emergencies, severe weather conditions, and if patients cancel with sufficient notice</li> </ul>	Not reported
United Kingdom – Scotland(158)	National (2004)	Various	To calculate waiting times in a way that will be fairer, more open to scrutiny, more understandable, and which will help put patients at the centre of their care	<ul style="list-style-type: none"> <li>• Process was implemented where periods of patient unavailability were reviewed regularly, so that no-one remained unavailable for treatment for more than 3 months without a check on their status</li> <li>• New arrangement also meant that patients had to take responsibility for accepting and keeping a reasonable offer of an outpatient consultation or hospital admission for treatment</li> <li>• Patients who failed to turn up for an appointment or admission without prior warning will return to the start of the waiting queue, unless there were clinical or other compelling reasons for treating them more quickly</li> <li>• Effectively they would have their waiting times “clock” returned to zero</li> </ul>	Not reported

Table S21. Operations research/ resource planning tools

Authors, year, country	Jurisdiction	Healthcare setting and types of elective surgeries addressed	Problem/issue addressed through simulation modeling	Purpose of modeling	Model type/ method	Main assumptions of the model	Information sources/inputs into the model	Findings	Implementation of findings/ impact
Abasolo et al 2014(205) Spain	Spanish National Health System	Healthcare regions <ul style="list-style-type: none"> <li>• Cholecystectomy</li> <li>• Carpal tunnel release</li> <li>• Inguinal/femoral hernia repair</li> </ul>	<ul style="list-style-type: none"> <li>• Heterogeneous reporting of wait times across regions</li> <li>• Total wait times not reported – instead, waiting times reported for each stage in a patient pathway to surgery (family doctor referral to specialist consult to completion of diagnostic tests to second specialist consult to scheduling of surgery date)</li> </ul>	<ol style="list-style-type: none"> <li>1) To determine total wait times for three elective surgeries</li> <li>2) Demonstrate impact of determining wait time for each subsequent stage based on time waited to complete previous stage (alternative wait time management system)</li> </ol>	<ul style="list-style-type: none"> <li>• Used Software Easyfit 5.3 Professional and MatLab</li> <li>• Simulated waiting time distribution for each stage</li> <li>• Added simulated wait time for each stage to calculate total wait time</li> <li>• Created a hypothetical patient cohort to run a simulation exercise in which wait time for subsequent stage depended on time waited in previous stage (i.e., those who waited longer for first visit received greater priority for second visit)</li> </ul>	<ul style="list-style-type: none"> <li>• Data from two regional health services were representative of all regional health services</li> <li>• All patients in hypothetical cohort had same clinical need</li> <li>• No increase in use of healthcare resources</li> </ul>	<ul style="list-style-type: none"> <li>• Published wait time data for each stage from two regional health services in 2009</li> </ul>	<ul style="list-style-type: none"> <li>• Estimated average total wait times: <ul style="list-style-type: none"> <li>- Cholecystectomy: 331 days</li> <li>- Carpal tunnel release: 355 days</li> <li>- Inguinal/femoral hernia repair: 137 days</li> </ul> </li> <li>• Estimated maximum reduction in wait times based on alternative wait time management system: <ul style="list-style-type: none"> <li>- Cholecystectomy: 11%</li> <li>- Carpal tunnel release: 15%</li> <li>- Inguinal/femoral hernia repair: not reported</li> </ul> </li> <li>• Through alternative system, overall variability and maximum wait times could be reduced with no additional costs</li> </ul>	No information found
Januleviciute et al 2013(186) Norway	Norway and Scotland	Regional health authorities (RHAs) in Norway  Regional health boards  <ul style="list-style-type: none"> <li>• Inpatient surgical and non-surgical services</li> </ul>	Both countries have introduced reforms, the effects of which had not been assessed <ul style="list-style-type: none"> <li>• Scotland: introduced blanket maximum waiting time targets</li> <li>• Norway: passed act in which</li> </ul>	To assess consequences of two different waiting time strategies, one in Norway (vertical prioritization) and one in Scotland (blanket prioritization)	<ul style="list-style-type: none"> <li>• Assigned ICD-10 codes to medical conditions of patients in both the Norwegian and Scottish registers</li> <li>• Patients assigned to maximum acceptable waiting time groups based on ICD-10 code</li> <li>• Used exact matching to construct pre and post-reform groups with similar observable characteristics</li> </ul>	<ul style="list-style-type: none"> <li>• Impact of policy change (reform) observable within a two year period (pre and post reform)</li> </ul>	<ul style="list-style-type: none"> <li>• National administrative data pre and post-reforms in each of the countries (2003-2006)</li> </ul>	<ul style="list-style-type: none"> <li>• Norway <ul style="list-style-type: none"> <li>- Wait times for highest priority patients increased by 6 to 9% post-reform</li> <li>- Wait times for low and no priority groups decreased by 4 and 7 days, respectively post reform</li> </ul> </li> <li>• Scotland <ul style="list-style-type: none"> <li>- With the exception of the highest priority group, wait times</li> </ul> </li> </ul>	No information found

Table S21. Operations research/ resource planning tools

Authors, year, country	Jurisdiction	Healthcare setting and types of elective surgeries addressed	Problem/issue addressed through simulation modeling	Purpose of modeling	Model type/ method	Main assumptions of the model	Information sources/inputs into the model	Findings	Implementation of findings/ impact
			assessment of a patient for elective services must consider: 1) severity of the condition, 2) whether a suitable treatment exists, and 3) cost-effectiveness of treatment; assessment must take place within 30 days of referral	•Are more severely ill patients prioritized better where vertical prioritization is implemented through differential maximum waiting times?	• Undertook weighted regression of patient level waiting times on patient characteristics • Performed multivariate regression analyses to compare changes in conditional mean waiting times over time			were longer pre-reform - Waiting times for highest priority patients were unaffected by reforms • In both countries, patients with lowest priority benefited most from reforms	
Tako et al 2013(206) United Kingdom	National Health Service in England	Multidisciplinary obesity centre providing non-surgical and surgical services to same patient population within Academic Health Science Centre • Bariatric surgery	Number of referrals received was rapidly growing, increasing pressure on the Centre to meet demand and achieve the 18 week target from referral to treatment set by the UK government	To examine the effect of alternative resource configurations on patient wait times to inform prioritization of planned investments in new capacity	• Discrete event simulation (Simul8 software) • Constructed a series of models that explored increasing capacity to meet demand or managing demand through a reduction in referral rates • Incorporated care pathway that included all non-surgical and surgical treatment options • Simulations based on one year with time unit of one day • Obesity care team determined six feasible scenarios to be represented in models – involved varying number of physicians and number of surgeons, and reducing referrals to half of baseline figures	• Capacity modeled as available patient appointments/slots • No patient attends two clinics in one day • Capacity relevant to study related to the number of physicians and surgeons and infrastructure components • Repeat outpatient appointments for follow-up after treatment excluded • Surgery allocation based on first in first out rule	• Clinic records of patients seen at the Centre • Administrative data collected by the Centre • Expert opinion (waiting time between clinics)	• Increasing capacity of pharmacotherapy clinics by adding one physician reduced waiting times for pharmacotherapy treatment but increased waiting times for surgery • Increasing surgical capacity by adding two surgeons reduced the proportion of patients waiting longer than 18 weeks to 8% • Reducing referrals to only patients with sleep apnea, diabetes, high cardiovascular risk or infertility reduced the proportion of patients waiting more than 18 weeks to 0 by the last month of the first year	• Based on the findings, the Trust decided to: 1) Add more surgeons, rather than physicians, alone 2) Change the eligibility criteria for surgery 3) Build a new operating theatre

Table S21. Operations research/ resource planning tools

Authors, year, country	Jurisdiction	Healthcare setting and types of elective surgeries addressed	Problem/issue addressed through simulation modeling	Purpose of modeling	Model type/ method	Main assumptions of the model	Information sources/inputs into the model	Findings	Implementation of findings/ impact
					<ul style="list-style-type: none"> <li>• Models considered the following performance indicators:</li> <li>1) Waiting list size for introductory group session</li> <li>2) Waiting list size for pharmacotherapy clinic</li> <li>3) Waiting list size for surgery</li> <li>4) Waiting time to surgery</li> <li>5) Proportion of patients waiting more than 18 weeks from referral to treatment</li> </ul>				

Table S22. Organization incentives

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
<i>Pay-for-performance (financial)</i>					
Norway(207, 208)	National pilot (2014)	Various	Not reported	<ul style="list-style-type: none"> <li>• Introduced in 2014 as a pilot project and represented only 0.5% of the budget (NOK 500 million)</li> <li>• The system used a point system of up to 100,000 and each Health Authority was rewarded with points based on a set of quality indicators and performance criteria</li> <li>• Indicators and performance criteria included: five-year survival for specific types of cancer; 30-day survival after hospital admission; waiting time violations; treatment of cancer performed within the wait time targets (from referral to surgery); and patient satisfaction</li> <li>• Payment was redistributed between Health Authorities depending on their performance levels and improvement relative to the other Health Authorities</li> </ul>	Not reported
Sweden (162)	National (2008-2011)	Various	To reduce wait time for elective surgery	<ul style="list-style-type: none"> <li>• An economic incentive was introduced in 2008</li> <li>• Money was given to counties that reached the wait time targets: wait times 1 and 2</li> </ul>	<i>Grey literature:</i> <ul style="list-style-type: none"> <li>• The number of patients waiting more than 90 days to see a specialist declined during this period</li> <li>• The number of patients waiting more than 90 days to receive treatment also declined during this period</li> </ul>
<i>Non-financial</i>					
United Kingdom – England(169)	National (2000)	Various	To reduce wait times for elective surgery	<ul style="list-style-type: none"> <li>• As part of National-level wait time guarantees, the Government introduced incentives and sanctions</li> <li>• Waiting times from referral to inpatient admission, with a limited set of other key targets and a ‘balanced score card’ of a wider set of indicators, were used to calculate an annual star rating (which ranged from zero to three) for each NHS hospital</li> <li>• These were published and used as a basis for direct sanctions and rewards</li> <li>• The sanctions were the dismissal of key managers of hospitals for poor performance against these targets and the rewards were the granting of greater autonomy (the freedom to keep certain surpluses and less central control) for hospital managers who performed well</li> </ul>	<i>Peer reviewed literature:</i> <ul style="list-style-type: none"> <li>• One retrospective study based on census and hospital data compared wait time reductions after 2001 between England and Scotland</li> <li>• The study reported that the proportion of patients waiting longer than 6 months for treatment fell by 6 to 9% points more in England than Scotland. The study also reported that the percentage of patients waiting more than 6 months for care was 14% in those with the ASC code and 28% for those patients in Scotland without the Availability Status Code</li> <li>• An ASC is assigned to patients who were not available or suitable for treatment</li> </ul>

Table S22. Organization incentives

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
<i>Negative financial incentives</i>					
<b>United Kingdom – England(98, 162)</b>	National (2011)	Various	To reduce wait times for elective surgery	<ul style="list-style-type: none"> <li>• A wait time guarantee was given to all patients</li> <li>• The guarantee covers the whole patient journey from referral to initial treatment.</li> <li>• By law, patients are given options of other providers (public or private) if guarantee cannot be fulfilled.</li> <li>• NHS also sets operational standards in which at least 90-95% of patients have to start treatment within 18 weeks of referral.</li> <li>• Providers are monitored on a monthly basis and breach of the operational standard will result in up to 5% reduction in revenue</li> </ul>	<p><i>Peer reviewed literature:</i></p> <p>Interviews with family doctors, oncologists and surgeons about the wait time targets were conducted. Overall, they were positive about the targets. However, the following concerns were raised: wait time targets take a ‘one-size fits all’ approach; providers are under considerable pressure; waiting time targets over-rode patients and providers choice(98).</p>

Table S23. Post-discharge follow-up by telephone

Jurisdiction	Healthcare setting (year implemented)	Specialty area	Purpose	Description	Impact
Canada- Alberta (interview)	Clinic (Not reported)	Various	Not reported	• Some surgeons' offices have followed-up with patients by phone; however, this is not standard across the province	Not reported
Ireland(209)	Hospital (2010)	Various	To reduce unnecessary outpatient follow up and increase surgical consultation slots of new referrals	<ul style="list-style-type: none"> <li>• In a pilot study, patients were sent a standardized "outpatient text message" at 2 weeks after their discharge from hospital enquiring their progress</li> <li>• Depending on the response received, the patient was either discharged back to family doctor or returned to the next scheduled outpatient clinic</li> <li>• Phone used for discharge was also carried by different members of the surgical team</li> <li>• Patients had access to the phone number for medical queries should they wish to contact their surgical team directly</li> </ul>	<i>Peer reviewed literature:</i> <ul style="list-style-type: none"> <li>• Pilot study of 55 patients</li> <li>• Before the scheduled 2-week interval had passed, 9 patients called the phone number</li> <li>• Of these patients, 8 were scheduled for the next outpatient clinic and 1 was asked to attend the ER for direct admission by the surgical team</li> <li>• 41 (74.5%) patients replied that they were well and were discharged from follow up, thus 41 visits to outpatients were avoided</li> <li>• 5 (9.1%) patients did not reply the text and were scheduled an outpatient clinic</li> <li>• 29 (52.7%) patients responded a satisfaction survey and all rated the service as either "extremely useful" or "very useful"</li> </ul>
Ireland(210)	Hospital (2010)	Various	To reduce unnecessary outpatient follow up and increase surgical consultation slots of new referrals	<ul style="list-style-type: none"> <li>• In a study at a single clinic, patients were randomized to either receive histologic results by phone or in person</li> <li>• Any further intervention required was arranged during the telephone follow up call</li> </ul>	<i>Peer reviewed literature:</i> <ul style="list-style-type: none"> <li>• 79 patients were randomized to clinic of whom 56 attended: <ul style="list-style-type: none"> <li>- 70% were discharged to primary care</li> <li>- 17% were booked for surveillance endoscopy</li> <li>- 5% were referred to another service</li> <li>- 7% required general surgical follow up</li> </ul> </li> <li>• 108 patients were randomized to phone follow up of whom 98 were contactable: <ul style="list-style-type: none"> <li>- 90% were discharged to primary care</li> <li>- 5% required further clinic appointments</li> <li>- 5% required further surgical procedures</li> </ul> </li> </ul>

Table S24. Public reporting of wait times

Jurisdiction	Specialty area	Wait 1	Wait 2	Description	Wait time measures	Impact
Canada- Nova Scotia(211)	Cardiac Dental ENT General Neurosurgery Obstetrics/ gynecology Oral maxillofacial Orthopedic Plastic Thoracic Urology Vascular	Yes (referral to first appointment with surgeon)	Yes (decision to treat to completion of procedure)	• Reported by procedure, for province and by hospital and surgeon	• 50 <sup>th</sup> and 90 <sup>th</sup> percentile wait times	Not reported
Canada- Ontario(212)	Cardiothoracic Ophthalmology Orthopedic Oncology Pediatric	Yes (from referral to first appointment with surgeon)	Yes (decision to treat to completion of procedure)	• Reported by procedure or urgency, for the province and by hospital, city, and postal code • Data source: Wait Time Information System, which is built on point-of-care data entry	• Average wait time • % of patients treated within target time	Not reported
Denmark(156)	Cardiothoracic ENT Gastrointestinal General Obstetrics/ gynecology Oncology Oral maxillofacial Ophthalmology Neurology Plastic Respiratory Urology	Yes (“wait for examination”)	Yes (“wait for treatment”)	• Reported by procedure and hospital • Overall patient satisfaction also reported	Not reported	<i>Grey literature:</i> * • In Denmark, only 5% of the patients exercised their right to choose their provider • Aggregate mean waiting time increased before it decreased  *Note: impact based on implementation alongside other approaches (i.e. patient choice of surgeon)
Netherlands(213, 214)	Not reported	Yes	Yes	• Since 2009, the Dutch Healthcare Authority requires hospitals and freestanding clinics to publish monthly consumer information about waiting times in weeks (rounded off upwards, implying a minimum waiting time of one week) for a specified list of medical specialties and treatments using the following definitions:	Not reported	<i>Peer reviewed literature:</i> * • Despite the availability of public information about waiting times and health insurers’ mediation services, for several procedures waiting times 2 substantially vary across hospitals  <i>Grey literature:</i> * • For 50% of the hospitals and specialists the interest for waiting times, urged them to take extra measures on organization, efficiency and consultation

Table S24. Public reporting of wait times

Jurisdiction	Specialty area	Wait 1	Wait 2	Description	Wait time measures	Impact
				<ul style="list-style-type: none"> <li>• Waiting time out-patient clinic – The number of weeks between the moment the patient makes an appointment with an out-patient clinic and the third opportunity he/she can visit the out-patient clinic according to the clinic’s appointment registry</li> <li>• Waiting time hospital treatment (day-case and inpatient admission) – The number of weeks between the moment the patient is indicated for treatment by a physician (in the out-patient clinic) and the third opportunity he/she can be admitted to, or treated in, the hospital according to the hospital’s appointment registry. In case of multiple treatments, the waiting time for the most common treatment has to be provided</li> </ul>		<ul style="list-style-type: none"> <li>• 60% of patients chose to stay at their own hospital, even though wait time was longer; 40% chose to go to a different hospital if the wait time at the other hospital was shorter</li> <li>• During the experiments, the number of people on the waiting list dropped by 10%</li> </ul> <p>*Note: impact based on implementation alongside other approaches (i.e. patient choice of surgeon)</p>
New Zealand(215)	Various	Yes	Yes	<ul style="list-style-type: none"> <li>• Eight key performance indicators are measured and publicly reported monthly</li> <li>• Reported by district health board (DHB)</li> </ul>	<ul style="list-style-type: none"> <li>• DHB services that appropriately acknowledge and process patient referrals within required timeframe</li> <li>• Patients waiting longer than the required timeframe for their first specialist assessment</li> <li>• Patients waiting without a commitment to treatment whose priorities are higher than the actual treatment threshold</li> <li>• Patients given a commitment to treatment but not treated within the required timeframe</li> <li>• Patients in active review who have not received a clinical assessment within the last six months</li> <li>• The proportion of patients treated who were prioritised using nationally recognised processes or tools</li> </ul>	Not reported
United Kingdom(216)	Various	Yes	Yes	<ul style="list-style-type: none"> <li>• Patients book appointments through the NHS e-Referral services,</li> </ul>	Not reported	Not reported

Table S24. Public reporting of wait times

Jurisdiction	Specialty area	Wait 1	Wait 2	Description	Wait time measures	Impact
				which provides that average waiting times by hospital/clinic for the specialty or service the procedure sits under as a whole (e.g. orthopedic)
